The practice site not only mimics the functionality of the operational test site, it also runs under the same engine, although it may be configured differently. Of course, the practice test can be accessed using non-secure browsers as well as secure ones. Configurable features include the following:

- Test Blueprint—the Department can choose which content areas and items to include in this site. Practice tests can have different blueprints than their operational counterparts.
- Anonymous Students—the Department can choose whether students who use this site have to be preregistered in the system.
- Anonymous Test Administrators—the Department can choose whether Test Administrators who use this site have to be preregistered in the system. For example, parents who are helping their children pre¬pare for the test may want to play the role of Test Administrator and create sessions for the tests their children are practicing.
- Instant Score—the Department can choose what scores or other information to display to the student at the end of the test.
- Accommodations and Modifications—any accommodation or modification can be turned off or on by test.

The practice test site can be entered in either a proctored (educator) or un-proctored (public) mode. In the un-proctored mode, users simply enter the site and take a test. We make the proctored mode available so that Test Administrators can practice the authentication routines with their students prior to testing if they choose. In the proctored mode, the students and Test Administrator go through the usual authentication procedures.

We propose to provide online practice tests for the ELA/L and Mathematics assessments, the EOC assessment, and the Writing Assessment approximately 6-8 weeks before the specific test window begins. All practice tests will adhere to the Department's specifications. Below we discuss the functionality and benefits of the online practice tests in more detail.

Easy-to-Use Online Practice Tests for Test Administrators and Students

For parents and educators to use the online practice tests, ease of use is critical. Unlike Florida's current online practice tests, AIR's online practice tests do not require any test content to be downloaded on student machines prior to their taking a practice test. AIR's practice test is accessible from any machine using a standard browser or AIR's Secure Browser.

The online practice test will be deployed using the same test delivery engine as the operational test. For this reason, the ancillary materials such as user guides and administration manuals for the operational test will apply equally well to the practice test. In addition, we propose to produce a "quick start" guide—an online pamphlet of approximately one page that describes the basics of starting and taking a practice test. The online practice test will also include help screens, an integrated user's guide, embedded tutorials, and other supports to help users learn the system (see Section 7.3.7.5 for more information).

Test Item Specifications

AIR has worked closely with all of our clients to create thorough item and test specifications. These documents clearly outline the ways in which item writers and test developers create assessments. AIR proposes to use these specifications as a starting point to develop similar specifications documents for Florida's assessments.

Our item specifications provide the sturdy scaffolding upon which item writers can take concepts and build them into clearly defined, measurable tasks. We have created detailed specifications documents in each grade and in each content area that

- address the content standard;
- define the limits of how that standard might be measured;
- propose acceptable response mechanisms for measuring the standard (based on the full suite of item types that AIR offers);
- propose ways in which each Depth of Knowledge category can be achieved; and
- provide sample items that address the standard. Sample items include an expected range of item difficulty.

In addition to these item specifications, we have also developed extensive passage specifications.

For a more detailed discussion on the Test Specifications we propose for Florida, please see Section 7.3.1. AIR will work with the Department to ensure that all test item specifications align with the Department's high expectations for item quality and stand the test of Content Advisory Committee review.

7.3.8 Production of Printed Test Materials

AIR has teamed with DRC to provide printing of all materials for the paper-based tests (PBT), including accommodated materials, and test administration and ancillary materials. AIR has collaborated with DRC in this capacity for other assessment programs since 2006. AIR and DRC have extensive experience in producing documents that are attractive and error-free and take great pride in the quality of testing materials produced on behalf of our department of education clients. Specific information on DRC's materials production and printing processes and experience is provided below.

For the Florida Standards Assessments (FSA), AIR team member DRC will

- print test booklets using print-ready files provided by AIR;
- design, develop, and print scannable answer documents to correspond with the appropriate test booklets;
- produce and print Braille, large print, and one-item-per-page (OIPP) special format materials using the final base test forms produced by AIR;
- print PBT test administration manuals using print-ready files produced by AIR;
- contribute and review content regarding PBT administration procedures;
- print student PreID labels and PreID rosters using student PreID data files provided by AIR; and
- print other supporting administration materials, including administration record/security checklists, packing lists, pallet lists, shipping cover memoranda, return shipping labels, materials return kits and materials, paper bands, manipulatives, and other miscellaneous administration materials determined by the Department.

Please see Appendix B for AIR and DRC's proposed Materials List and Appendix C for samples of testing-related materials DRC has produced for other large-scale state assessment programs. DRC will provide all materials in the appropriate formats and will distribute materials in sufficient quantities to Florida districts and schools. Please see Section 7.3.11 for a discussion on producing Braille, large print, and OIPP materials; Section 7.4.1 for information on DRC's packing and distribution processes; and Section 7.4.7 for details on ancillary materials

Producing All Versions of Materials and Products

AIR understands it is responsible for producing all versions of the materials and products developed for this contract, including test forms. Detailed responses to materials requirements are included in Section 7.3.7, 7.3.8, 7.3.9, and 7.3.10. In Section 7.3.11, we describe in detail our approach to producing paper-based accommodated test materials.

Proofreading Documents During All Stages of Production

As described in our response to 7.4.6, AIR has developed an editorial review process for materials production that minimizes errors and allows client review at each appropriate stage of production. Readers are directed to Section 7.4.6 for a complete description of this process, including points at which AIR will obtain Department feedback and approval. Qualifying persons who will be responsible for proofreading are included in the organizational chart in Section 7.7, and their resumes are included in Appendix A.

Quality of Printing

AIR will develop and publish print-ready files of all test materials except scannable answer documents, special format material accommodations, and PBT ancillary materials. DRC will print all PBT materials using the final Department-approved print ready files and produce special format materials using the final approved base forms provided by AIR. AIR and DRC understand that any changes after signoff will require Department approval. Please see Sections 7.3.7–7.3.11 and 7.4.6 for a detailed discussion of AIR's materials publication and production processes. Printing, publishing, and distribution of test materials will not begin until final approval has been provided by the Department. DRC's materials production and printing quality processes are described in detail below.

DRC's Materials Production Quality Processes

DRC's Editing Services provides professional technical editing and copyediting of assessment materials for its department of education clients. The Document/Graphic Design Group is staffed with highly experienced desktop publishers, graphic designers, and proofreading professionals. DRC uses the latest design and publishing software and works with multiple file formats and platforms. Please see Section 7.7 for information on DRC's proposed publishing and proofreading staff. Resumes are included in Appendix A.

DRC's ISO 9001:2008 certified full-service Document Services produces materials from typesetting to editing and printing. DRC's printing presses allow it to print both scannable and non-scannable documents. DRC also has variable intelligent printing (VIP) capability, and provides complete, custom finishing services. DRC has the capacity to allocate significant and superior printing resources. In addition to ISO 9001 certification, DRC has earned Quality Level II status from the Government Printing Office (GPO), which is the second highest status that can be awarded (Quality Level I status is reserved for printers who produce bound books, four-color varnished promotional pieces, or other similar materials). To obtain this quality status, DRC underwent a rigorous review and inspection process, including work samples and process documentation.

AIR and DRC understand that the Department requires error-free materials and that we have the ultimate responsibility for the quality and accuracy of the testing materials. DRC knows it is essential that all test materials are in their intended and technically correct format. To this end, DRC follows a meticulous set of quality standards to ensure high-quality printed products for its clients. The Department can be assured of AIR and DRC's commitment to produce attractive, error-free materials.

The quality processes AIR and DRC will use to achieve error-free production include:

- **Materials Publishing Review and Quality Check**—AIR will conduct word-for-word proofreading during the electronic publishing stage (typesetting and layout) of all test materials except scannable answer documents and special format material accommodations. AIR will also conduct a final review of test booklets, answer documents, and correlating test administration manuals and instructions to confirm that all directions work in concert and are accurate and easy to follow. Prior to bulk printing, AIR will conduct final reviews of printer's proofs of regular PBT materials.

DRC will conduct word-for-word proofreading for large print and OIPP materials to ensure that these materials align with the base form(s) approved by the Department. DRC will also conduct a final review of the large print and

OIPP test booklets and correlating test administration manuals and instructions to confirm that all directions work in concert and are accurate and easy to follow. Prior to bulk printing, DRC will conduct final reviews of special format materials printer's proofs. DRC's Braille vendor will conduct similar proofreading and final reviews of Braille materials prior to reproduction. The Department will review and approve special format materials, including Braille materials, using the materials development and review processes described in Section 7.3.7–7.3.10. Please see Section 7.3.11.1 for more information on DRC's processes for producing accommodated materials.

- **Information Systems Review and Quality Check**—DRC will certify that all scannable documents are designed, developed, and printed within specified scanning requirements and tolerances. This technical review ensures error-free processing of scannable documents that will prevent delays in the data delivery and reporting schedule. Please see the next subheading for more information on scannable document printing.
- **Printers Reviews and Quality Checks**—AIR and DRC will conduct final reviews of printer's proofs prior to bulk printing. Working closely with print vendors, DRC will check press proofs to make sure print quality meets DRC standards (e.g., ink consistency, smudge marks, sequential numbering) and verify adherence to printing specifications. DRC will require every thousandth document be pulled to check print quality throughout the print run.
- **Materials Finishing Quality Checks**—DRC Project Management and Print Procurement personnel oversee materials finishing, including the collating, stitching, and trimming phases. Post-printing processes (e.g., security barcoding, spiraling, shrinkwrapping) are also monitored to ensure specifications are being followed consistently and accurately.

DRC successfully uses these quality procedures for its State Department of Education clients and is confident that their materials production protocols and standards will meet the accuracy requirements of the FSA. Please see Appendix C, for samples of high-quality test materials that DRC has produced for large-scale state assessment programs. DRC's proposed Operations Project Manager, Mr. Doyle Kirkeby, will provide the Department with written notification of any issues encountered during the materials production and printing process and will consult with AIR and all appropriate DRC departments to suggest solutions to any issues. Please see Production Errors below for more discussion of issue and error management.

Scannable Document Printing

Scannable document printing requires a mastery of the equipment that only years of training, experience, and dedication to the process can achieve. Documents printed at DRC are printed to exacting specifications to guarantee the highest possible data integrity for DRC's state-of the-art image scanning systems. DRC prints 520 million scannable pages and produces 12 million test booklets a year. DRC stocks only those papers that provide the proper reflectance required by its leading imaging scanners. The same holds true for DRC's inks; all have been tested and formulated to impart a crisp, clean look to the product for superior aesthetic appeal and also to dropout in the proper measures for accurate data capture during the scanning process. With each document, DRC's skilled press operators hold their presses to incredible tolerances, exceeding even the strictest industry standards.

Security Plan for Production of Test Documents

Because DRC's Document Services Division is under its direct control, a majority of the printing for clients is completed by DRC staff at its fully secure printing facility. If outside printing vendors are used, they are evaluated and monitored against DRC's stringent security and quality standards. All vendors must certify adherence to these standards before documents are submitted to them for production. Please see below for additional details regarding DRC's printing vendor certification process.

All of DRC's secure facilities are designed to meet the stringent security requirements of large-scale testing programs. DRC enforces strict security measures to prohibit unauthorized personnel from access to client materials through either deliberate or unintentional action. All materials are handled and stored in an environment secure from access by the general public or any unauthorized employee. All DRC personnel are trained in and required to adhere to the company's security requirements.

The following corporate-wide facility and personnel security measures are in place at DRC:

- Employees use keycard identification badges to enter the DRC facilities. All employees, permanent and temporary, must wear a picture identification badge. Visitors to all DRC sites must sign in and are issued badges that must be worn at all times; visitors are accompanied by a DRC employee at all times.
- The secure access system keeps a log of all persons entering DRC facilities, including all after-hours and weekend activity.
- All employees receive training regarding DRC's stringent security procedures. Each employee must sign a confidentiality and security agreement and ensure privacy of all data, at all levels, at all times.
- Unauthorized personnel are not allowed in the materials assembly, receiving, check-in, or document processing and scanning areas.
- All incoming and outgoing shipments are "logged in" and "logged out."
- Confidentiality of individual and client data is maintained at all times.
- All electronic files are maintained at password-protected workstations and are accessible only to key personnel on the project.

Certification of Printing Vendors

DRC views its supply base as an extension of its business processes, holding its supply partners to the company's same high internal standards. The DRC's Vendor Management Program

- defines a set of DRC process specifications and other business requirements that supply partners are required to meet;
- utilizes an on-site business process assessment where key DRC Procurement and Quality staff members audit key supplier business processes; and
- requires monthly and annual business reviews of supplier performance (reviewing performance requirements around quality, delivery, and overall service). When necessary, corrective action plans and follow-up sessions are also included during these reviews.

DRC has adopted federal standards such as DIACAP and HIPAA practices to ensure it maintains the highest levels of security practices as possible. DRC's security practices are also documented and embedded into the DRC Quality Management system, which has been ISO 9001-compliant for over 6 years. These

practices are audited several times a year by DRC Internal Audit staff and a third-party ISO assessor.

DRC standards for printed products include the selection of reliable printing companies that can guarantee the level of quality and security implemented at DRC. DRC selects only printing vendors that have great sensitivity to state testing requirements and timelines and that have previous experience with printing educational testing materials. Each external printing vendor is required to maintain the strictest level of security during the production of materials and is asked to sign a security affidavit attesting to their commitment to this security. DRC Program Management, Quality, and Print Procurement staffs work with printing vendors during the print production phase. DRC staff routinely visits print vendors' sites during the printing, collating, and finishing of materials to verify that printers meet all quality standards and individual program specifications. DRC staff will be present during the first printing runs of each product, and at various times during the collating, stitching, and trimming phases. DRC staff will conduct checks to make certain that the print quality meets DRC standards (e.g., ink consistency, absence of smudge marks, sequential numbering, correct collating and binding). DRC requires the vendor to pull every thousandth document to monitor quality.

Production Errors

It will be AIR and DRC's responsibility to conduct a thorough final proofreading of all printed materials, and to ensure that all materials are correctly printed, sealed, and collated, with no errors. In the unlikely event that an issue occurs, within 30 days of the event, AIR and DRC will provide the Department with a root-cause analysis, including information on the cause and steps for resolution and improvement. We will also be responsible for any costs that are incurred for additional printing and distribution of defective or misprinted materials. Reprinted materials will be produced and distributed according to a timeline approved by the Department.

DRC's risk and issue management approach is based on proactive planning to prevent, mitigate, and resolve any project issues. Its issues management process enables the company to organize, maintain, and track any issues that may occur. DRC will use this established process to identify, address, prioritize, escalate, and resolve problems and issues:

- **Immediately communicate the issue in writing to AIR and the Department.** DRC's Project Manager will immediately contact AIR and the Department whenever a significant issue arises. Significant issues are defined as those that would impact timeliness of contract deliverables. DRC will not delay notification because of internal discussion or meetings.
- **Identify what needs to be done and resources needed to correct the issue.** The DRC Project Manager will work with internal DRC resource groups along with AIR and Department staff to determine the proper steps to resolve the issue.
- **Receive approval from the Department for appropriate action.** After working closely with all involved parties, AIR and DRC will propose a sound and cost-effective solution and process for improvement to the Department. AIR and DRC will not proceed with the solution until approval has been received from the Department.
- **Keep the Department informed on the status of the issue based on a frequency established by AIR and the Department.** AIR and DRC will communicate with the Department on a regular basis—as determined by the Department—regarding the solution for the issue.

- At least weekly, provide a listing of all issues with their current status, deadlines to correct and improve, and actual dates of completion that have occurred to AIR and the Department. These weekly reports will be submitted according to a schedule requested by the Department. Issues will also be documented in the monthly progress reports to the Department.

AIR is confident that DRC's issue management process will assure timely delivery and comprehensive materials production issue resolution.

7.3.9 Production of Computer-Delivered Products

Here we describe AIR's process for delivering computer-delivered products. AIR's well-honed processes enable us to deliver high-quality, reliable, and accurate online assessments. Here, we offer a high-level description of the key processes that lead to these outcomes.

The production of computer-delivered products involves two divergent types of products, each of which follows an appropriate quality process:

1. Content for online delivery shares some processes with paper versions, but also requires additional, unique steps.
2. Online test delivery software must deliver that content reliably, and with the right tools, accommodations, layouts, etc.

Below, we discuss our production process for content as well as our process for the production, configuration, and deployment of software.

Our test delivery system also has a real-time quality monitoring component built in. As students test, data flow through our *Quality Monitor* (QM) software. QM conducts a series of data integrity checks, ensuring, for example, that the record for each test contains information for each item that was supposed to be on the test, and that the test record contains no data from items that have been invalidated. QM scores the test, recalculates performance-level designations, calculates subscores, compares item parameters to the reference item parameters in the bank, and conducts a host of other checks.

QM also aggregates data to detect problems that become apparent only in the aggregate. For example, QM monitors item fit and flags items that perform differently operationally than their item parameters predict. This functions as a sort of automated key or rubric check, flagging items where data suggest a potential problem. This automated process is similar to the sorts of checks that are done for data review, but (a) they are done on operational data and (b) they are conducted in real time so that our psychometricians can catch and correct any problems before they have an opportunity to do any harm.

Production of Content

While the online workflow requires some additional steps, it actually removes a substantial amount of work from the critical path. Like a test book, an online system can deliver a sequence of items; however, the online system makes the layout of that sequence algorithmic. A paper form must await final forms construction before blackline proofs can show how the item will look in the booklet. Online, the appearance of the item screen can be known with certainty before the final test form is ever constructed. This characteristic of online forms enables us to lock down the final presentation of each item well before forms are constructed. In turn, this moves the final blueline review of items much earlier in the process, removing it from the critical path.

The production of computer-based tests includes five key steps:

1. Final content is previewed and approved in a process that we call *web approval*. Web approval packages the item exactly as it will display to the student.
2. Forms are finalized using the process described in Section 7.3.7, and final forms are approved in our FormBuilder software;
3. Complete test packages are created with our test packager, which gathers the content, form information, display information, and relevant scoring and psychometric information from the item bank and packages it for deployment.
4. Forms are initially deployed to a test site where they undergo *platform review,* a process during which we ensure that each item displays properly on a large number of platforms representative of those used in the field.
5. The final system is deployed to a staging environment accessible to our client for user acceptance testing and final review.

We discuss these steps below.

Web Approval of Content during Development

AIR's Item Tracking System (ITS) integrates directly with the Test Delivery System (TDS) display module, and displays the item exactly as it will appear to the student. We call this process *web preview,* and we tie web preview to specific review levels. Upon approval at those levels, the system locks content as it will be displayed to the student, transforming the item representation to the exact representation that will be rendered to the student. No change to the display content can occur without a subsequent web preview. This process freezes the display code that will present the item to the student.

Web approval functions as an item-by-item blueline review. It is the final rendering of the item as the student will see it. Layout changes can be made after this process in two ways:

1. Content can be revised and re-approved for web display.
2. Online style sheets can change to revise the layout of all items on the test.

Both of these processes are subject to strict change control protocols to ensure that accidental changes are not introduced. Below, we discuss automated quality control processes during content publication that raise warnings if item content has changed after the most recent web-approved content was generated.

The web approval process offers the benefit of allowing final layout review much earlier in the process, reducing the work that must be done during the very busy period just before tests go live.

Approval of Final Forms

Section 7.3.7 describes our process for constructing forms, including the approval of 1x1s by the Department. The forms are built in FormBuilder, a component of our ITS, and upon approval they are ready for preliminary publication. Please refer to Section 7.3.7 for a description of the quality processes for final form approval.

Packaging

AIR's test packaging system performs two simultaneous roles in the preparation of computer-based products: It compiles the form definitions and other information about how the test is to be administered (e.g., where any embedded field-test items might be inserted);

and pulls together the content packaged during web approval.

The test packager assigns form identifiers to each form, evaluates the form against the blueprint, and performs a quality check against the content. The content quality check includes checks to see that every asset (e.g., graphic) referenced in the item is included in the package, confirms that the item has not changed since it was web approved, and ensures that the items have received all the approvals necessary for publication.

Platform Review

Platform review is a process in which we check that each item displays appropriately on each platform. A platform is a combination of a hardware device and an operating system. In recent years the number of platforms has proliferated, and platform review now takes place on approximately 15 platforms that are significantly different from one another.

Platform review is conducted by a team. The team leader projects the item as it was web-approved in ITS, and team members, each behind a different platform, look at the same item to see that it renders as expected.

User Acceptance Testing and Final Review

Prior to deployment, the testing system and content are deployed to a staging server where they are subject to user acceptance testing (UAT). UAT of the test delivery system serves both a software evaluation and content approval role. We discuss the software aspects in the next section. The UAT period provides the Department with an opportunity to interact with the exact test with which the students will interact.

We understand that the Department may want to make authors' edits at this stage of the process. While we can support this if timelines are sufficient, we strongly encourage the Department to conduct these reviews and make these edits earlier in the process, ideally before web approval.

Functionality and Configuration

The items, both in themselves and as configured onto the tests, form one type of online product. The delivery of that test can be thought of as an independent service. Here, we document our process for delivering this service with industry-leading quality.

One area of quality unique to online delivery is the quality of the delivery system. Three activities provide for the predictable, reliable, quality performance of our system:

1. Testing on the system itself to ensure function, performance, and capacity
2. Capacity planning
3. Continuous monitoring

AIR's system is mature. It has been through many testing and operational cycles. With each system upgrade, the upgrade undergoes unit testing and the system undergoes integration testing and regression testing. Each deployment undergoes a rigorous load and performance test.

Our statisticians examine the delivery demands, including the number of tests to be delivered, the length of the window, and the historic state-specific behaviors to model the likely peak loads. Using data from the load tests, these calculations indicate the number of each type of server necessary to provide continuous, responsive service, and AIR contracts for service in excess of this amount.

Once deployed, our servers are monitored at the hardware, operating system, and software platform levels with monitoring software that

alerts our engineers at the first signs that trouble may be ahead. Our applications also log not only errors and exceptions, but latency (timing) information for critical database calls. This information enables us to know instantly whether the system is performing as designed, or if it is starting to slow down or experience a problem.

Our monitoring does not stop there. Each student test gathers latency data—data about how long it takes to load, view, or respond to an item. All of this information is logged as well, enabling us to identify automatically schools or districts experiencing unusual slowdowns, often before they even notice.

Functionality, Configuration, and User Acceptance Testing

Each year, AIR implements new features and capabilities in the test delivery system. These features are thoroughly tested through a mix of manual and automated testing, all of which follows a detailed and complete testing plan. These enhancements are made available to all of our clients at no additional cost (although costs may be incurred when content must be created or modified to exploit a feature). This has made our system very highly configurable.

AIR has a well-established process for walking through configuration options and documenting decisions. The configuration covers everything from styles and layouts to the particular accommodations offered with each test. AIR project managers will work with Department representatives to document the required configuration. Our TDS team will deploy the system to a staging site with the configured options, and that configuration is reviewed by our project team during a formal specification review. That staging site becomes the site for UAT, the process in which the Department will provide final signoff on the test as it will be deployed.

Load Testing

The ITN foresees peak loads of approximately 50 percent of the enrollment in the tested grades. AIR's system is designed to handle loads that high and much higher. Every function of our system can be scaled outward using our proprietary private cloud architecture. Supporting increased loads requires deploying more servers in the appropriate configuration. We note that our cloud is a private cloud, rather than a public cloud, which means that testing traffic is insulated from any other traffic in the data center, giving us the ability to fully control the system throughput.

Load testing happens in two stages. The first stage is a capacity planning stage, in which small numbers of servers (actually server constellations) are tested to the breaking point. This provides the information needed to know the total number of servers required to support the anticipated load. Capacity planning tests occur every few years as server technology improves. We are currently conducting these tests with new machines.

The second stage is the actual load test. Once the full set of servers is deployed, we generate a load exceeding the intended peak load. That load is generated by a large number of servers simulating students testing. For example, this winter we plan a load test of one system that will include 5,000 servers in a remote facility simulating the load produced by 500,000 students simultaneously testing.

AIR will be pleased to share load testing results with the Department.

User Acceptance Testing

Before each live deployment, AIR will deploy the system to the staging servers for a negotiated period of time for the Department and your designees to test the system with the

actual test forms deployed as they will be seen by students.

AIR will prepare a UAT plan, suggesting a wide range of cases to test, and will load the system with fictional students for Department testers to use while testing. Of course, the Department is welcome to help craft or expand the UAT plan, or simply try additional ad hoc cases during the UAT period.

Final approval of UAT triggers final deployment of the test.

7.3.10 Production of Paper-Based and Computer Test, Style Guide, and Braille Production Procedures

AIR will be responsible for all aspects of production of the computer-based testing (CBT) system, secure web-based reporting site, and printed materials, including formatting, graphics, and key entry. Each process and the details of the products will be fully documented in a style guide or appropriate specifications document. These documents and specifications are described throughout this project.

Readers are referred to the following sections for details of the production of the products, style guides, and specifications documents referenced in this section of the ITN:

- CBT system: Section 7.3.9
- Secure web-based reporting site: Section 7.5
- Printed materials: Section 7.3.8

AIR has established procedures for selecting and communicating print plans, including all necessary specifications. AIR is comfortable with providing these plans to the Department as required. AIR will also provide print samples showing type and size for all needed materials. AIR typically provides our clients copies of every review stage, and we will provide all final files as well.

Our partner, DRC, will print all additional materials, such as labels and packing sheets as required to ship materials. We note that our plan includes a real-time-ID supplement to the pre-ID process. This allows nearly real-time registration for students for both paper and online tests. Late arriving students can be registered for the test immediately before testing, and schools or districts may print out real-time-ID labels from the Test Information Distribution Engine (TIDE) on label stock that we will provide along with the shipments of books and other materials. Readers are referred to Section 7.4.1 for a detailed description of this process.

AIR will submit printing plans showing all needed specifications for a correct print run. AIR will also work with the Department to create a style guide that lays out exactly what the correct look and feel for printed materials is. This style guide will address form layout, font, and size, as well as all other needed specifications. AIR is comfortable either adapting the Department's current style guide for use in an online assessment, or AIR is also able to completely rewrite the style guide with the Department's input.

The style guide will include the editorial specifications. Typical information in a style guide includes appropriate formats for graphics, illustrations, tables, charts, graphs, and other style elements. The style guide would also include appropriate layouts, acceptable uses of punctuation, bolding, and underlining.

A glossary of preferred and accepted technical terms and phrases when referencing particular features of the online assessment should be specified to allow for consistency across items as well as student accessibility. Specifying text for specific guidance to examinees, such as "To

remove your selection, click it again," should be incorporated to ensure that students know exactly what is required of them in any specific task. The style and color of different item components should also be outlined in an updated style guide.

This updated style guide should be regularly reviewed. AIR has typically gathered comments throughout the year, and then included all gathered comments in the annual review cycle. Once the document has been agreed on, AIR will print revised comments as required.

Our test delivery specifications, described in Section 7.4.9.7, capture information about themes, styling, layouts, and other characteristics of the test. While some of the navigation details are configurable, the navigation elements themselves are integral to the functioning of the system. All text, including labels and messages, can be customized for the Florida Standards Assessment (FSA).

AIR will configure all of AIR's online system access points so they reflect the Department's preferred look ("skins") and color themes. Additionally, any print materials will be designed with the same themes so readers instantly make the connection to Florida statewide assessments across media. Last, we recognize that the overall communication plan will encompass other deliverables; we will make sure that each piece of information is coordinated and consistently "branded." AIR will use its practiced review procedures to ensure error-free and consistent branding across all Florida systems.

7.3.11 Produce Special Formats and Accommodations for Students With Disabilities

In the following sections, we discuss paper-based and computer-based accommodations AIR will provide for students with disabilities.

7.3.11.1 Paper-Based Accommodations

AIR and DRC are committed to fair accessibility for all students. AIR team member DRC will produce, print, and distribute all testing and administration materials for paper-based special format accommodations, including Braille, large print, and one-item-per-page (OIPP) materials. AIR and DRC understand that only one form for each test will be converted to Braille, large print, and OIPP versions. AIR will provide the final Department-approved versions of the selected test forms for conversion by DRC. AIR and DRC understand that in addition to test documents, we may also need to provide large print and/or Braille versions of the test administration manuals, up to five each per format per administration, if requested by districts. All paper-based accommodations materials, including test administration manuals, will be delivered to districts with the shipments of regular print materials.

DRC has worked with the National Center on Education Outcomes (NCEO) on many assessment projects, including the design and development of alternate assessments for students with disabilities and English language learners (ELL), as well as designing and facilitating standard settings for alternate assessments. DRC stays abreast of current legislation, technologies, and methodologies that impact universally designed assessments and retain staff members that are knowledgeable, trained, and experienced in developing and administering assessments that are accessible to all students.

AIR and DRC are ready to assist the Department with the development and administration of tests that are universally designed, provide for test accommodations/ modifications, and meet state and Federal legislation requirements.

Braille Versions

DRC has extensive experience managing the production of Braille test booklets and materials for many assessment programs, including those for Alaska, Louisiana, Minnesota, Pennsylvania, and South Carolina. Each year, DRC will work with staff from the nationally recognized American Printing House for the Blind (APH), to produce Braille test booklets and other materials for the FSA. APH is highly experienced with converting assessment materials; DRC has used their services on other testing programs with excellent results. APH will also provide transcription of Braille-format student responses (please see Section 7.5.4.4 for more information on transcription).

APH will ensure that all tests and materials are modified correctly and that they are accurate. Codes accepted by the Braille Authority of North America (BANA) will be followed. Test documents will be produced in both contracted and uncontracted Braille to accommodate all Florida students and will be distributed as requested by districts. Each Braille form for each test will be produced in two volumes. DRC and APH will maintain and update an internal document that identifies which APH professional, including role and name, will perform each Braille material production task, as well as detailed information about each task. This document will be made available as requested by the Department. In addition, AIR and DRC will ensure that all Braille materials are proofed by a certified Braille reader/independent party. DRC and APH will also produce Braille version test administrator notes and scripts to supplement the test administration manuals following the same production processes described in Section 7.4.6. Information on packaging and distributing special format tests is provided below, while Section 7.5.4.4 discusses processing and transcribing special format student responses.

The Braille test booklets and materials will be provided to the Department for review and approval before reproduction. AIR and DRC understand that the Department may also employ the services of a Braille proofreader. Braille versions will be available for test coordinators to order with the rest of their materials, and DRC will ensure that a sufficient number of copies are available for any last minute orders. DRC acknowledges that approximately 50 copies of each Braille material may be required for each grade level and subject area per administration. In addition, for each set of Braille forms distributed to districts, a copy of the corresponding regular print test booklet will be included. Each Braille test form will also be accompanied by six blank pages of Braille paper.

Large Print Versions

DRC has full, in-house capability to develop, produce, reformat, and print large print test materials. They have extensive experience providing large print materials for many state assessment clients, including Alaska, Louisiana, Minnesota, Pennsylvania, and South Carolina.

DRC will provide large print materials formatted to meet the needs of the Florida Standards Assessments. AIR and DRC will work with the Department during typesetting and production to ensure all specifications for the large print versions are met. DRC's experience, along with best practice, indicates that type size and line spacing should be adjusted to the student's reading and grade level. DRC also recommends providing the 14" x 17" booklets in a spiral binding that allows the book to open flat. DRC

understands that large print documents will be printed in a minimum of 18-point type, and that the paper and binding must be approved by the Department.

The large print test booklets will be provided to the Department for review and approval before reproduction. Large print versions will be available for test coordinators to order with the rest of their materials, and DRC will ensure that a sufficient number of copies are available for any last minute orders. DRC acknowledges that up to 400 large print copies may be required for each grade level and subject area per administration. In addition, for each set of large print forms distributed to districts, a copy of the corresponding regular print test booklet will be included. DRC will also provide large print reference standalone sheets and large print response grid instructions standalone sheets to accompany applicable assessment forms. Each computer-based test (CBT) Mathematics form will also be accompanied by one large print form of the CBT work folder, and each CBT English Language Arts/Literacy (ELA/L) assessment will be accompanied by one large print form of the CBT worksheet. DRC will also produce large print test administrator notes and scripts to supplement the test administration manuals, following the same production processes described in Section 7.4.6. Information on packaging and distributing special format tests is provided below, while Section 7.5.4.4 discusses processing and transcribing special format student responses.

One-Item-Per-Page/One-Sided Versions

AIR and DRC understand that the Department requires an OIPP special format for the FSA. DRC has extensive experience providing OIPP versions of testing materials for its assessment clients, including Louisiana, Nebraska, and South Carolina. Based on these experiences, DRC understands the unique issues associated with this type of accommodation, including font type and size, paper whiteness, positioning, graphic/stimulus appearance, and layout of passages/stimuli and corresponding items.

Because of the unique nature of the OIPP format, AIR and DRC will work with the Department to develop and clearly define all specifications prior to typesetting and production, particularly regarding paper type and quality and font style and size. Department review and feedback during the typesetting and production phases will be a key component of producing appropriate OIPP assessment materials. DRC understands that FSA OIPP materials will be printed on three-hole punched 8 ½" x 11" paper and collated and bound using binders. Each OIPP test form will be accompanied by the appropriate scannable answer document.

The OIPP test materials will be provided to the Department for review and approval before reproduction. AIR and DRC understand that the Department will provide a list of students requiring this accommodation, and that approximately 25 copies of each OIPP version may be required for each grade level per administration. DRC will also produce OIPP version test administrator notes and scripts to supplement the test administration manuals following the same production processes described in Section 7.4.6. Information on packaging and distributing special format tests is provided below, while Section 7.5.4.4 discusses processing and transcribing special format student responses.

Packaging and Delivery of Special Print Materials

All Braille, large print, and OIPP materials will be packaged separately and delivered to districts with the regular print shipments. DRC is accustomed to packaging, shipping, and receiv-

ing special format materials. These materials will be handled with the same quality and security procedures used with other FSA testing materials (please see Section 7.4.1). DRC's receipt processes for accommodated materials require little document preparation by schools and districts. Unlike many testing companies, DRC does not require special packaging, return, and processing procedures for accommodated materials. DRC will provide a clear, well-documented return process for Braille, large print, and OIPP materials, increasing the accuracy and decreasing turnaround time of return shipments. Please see Section 7.5.4.4 for more information on processing and transcribing special print test materials.

Paper Accommodations for Computer-Based Reading Tests

AIR and DRC understand that Reading Passage Booklets will be provided for students that require paper-based handwritten strategies for completing computer-based assessments. These booklets will be provided in regular print and large print format as required.

7.3.11.2 Computer-Based Accommodations

AIR's Online Test Delivery System (TDS) is designed for maximum accessibility.

In Oregon during the 2012–2013 school year, all students eligible for the general assessment tested online. Students requiring a paper accommodation were tested online using the secure "print-on-demand" accommodation. Students requiring Braille were served using real-time embossing and refreshable Braille displays. Other than the Extended Assessment for students with severe cognitive disabilities, the only test Oregon makes available to students offline is the writing assessment, which 23,456 students took in paper form last year. In Hawaii, during the 2012–2013 school year, 221,552 students sat for assessments. Of that number, only eight completed a paper version of the test.

AIR's approach to accessibility favors universal design over separate accommodations. Each of our accessibility features can be configured for universal access (all students can access the feature) or for access by specific students. Features that are configured for access by specific students are set remotely by the test administrator or other authorized adult (such as a school or district test coordinator or a state-level administrator) working on a separate workstation. Florida will have the option to have accessibility features (screen reader, font size, background color, glossary, etc.) for a given student set in advance through TIDE, through either an upload or user interface, or set in real time by the test administrator through the TA Interface. The system can be configured to have each accommodation settable through either mechanism or both mechanisms, and supports different mechanisms for different accommodations.

In general we recommend that most features, even those that are universally available, be set by adults prior to testing, rather than the student interface. The reason for this recommendation is that the sheer number of features can create a distraction in the student interface. Students may play around and change background colors, experiment with text-to-speech voices, play with masks and guides, etc. Therefore, too many student choices can actually reduce access.

Providing these tools through context menus, rather than through keyboard shortcuts, results in a usable and accessible student interface. Students who cannot use a keyboard often use assistive devices such as switch arrays that generate a limited number of keyboard commands. Maintaining compatibility with these devices precludes creating keyboard

shortcuts for each of the many features offered; many devices cannot generate that many different codes.

Usability for all students also favors a context-menu approach. Many tools are available, but most are relevant only in a limited number of contexts. For example, the response choice eliminator (strikethrough) is only relevant for selected response items, and only for their response options. Therefore, this option is only offered when a student brings up the menu on a response option. The screen would be cluttered with many, many icons and buttons if all tools were available at all times. Context menus offer users the capabilities that are both available and relevant to their current task.

Section 7.4.9.6 discusses the accessibility features and embedded supports provided in the system. Exhibit 7.3.11.2-1 summarizes those features, followed by a discussion of the specific features identified in the ITN.

Below, we discuss each of the accommodations required in Florida's ITN in greater detail.

Screen Reader

The test delivery system supports text-to-speech through built-in, configurable text-to-speech, and through support for third-party screen readers. AIR's system provides text-to-speech in English and other languages designated by the client. Items are annotated so that equations, graphics, etc. are read correctly. Students can use the native voice packs available on their computer system or a variety of commercially available voice packs. AIR also provides, at no cost, a commercial Spanish voice pack for Windows. In addition, AIR offers, at no cost, a high-quality English language voice pack for Windows machines, because older Windows machines often have lower-quality voice packs installed. Students can set speed, volume, and pitch before starting a test.

AIR's powerful text-to-speech system allows varying levels of support according to rules that we can configure in consultation with Florida. Thus, while some students may have (for example) only question text read to them, other students may also need descriptions of tables and graphics read aloud. These differentiated supports can be configured to meet Florida's needs within broad boundaries.

Additionally, within the parameters set by Florida, students can choose to have only sections of text read to them. For example, after hearing an entire item a student may want to listen to one of the response options a second time. Using the context menus built into AIR's online testing system, the students can choose to have just one response option or a section of text read aloud.

For third-party screen-readers AIR's test renders in our streamlined interface which works with most commercial screen readers. Items are also tagged for access by students who are blind as non-visual navigation requires different tags and annotations.

Screen readers can also output text to a refreshable Braille display (RBD). Equations and graphics cannot be output to an RBD, so real-time embossing is also available and built into our system. Specifically, we render items to desktop embossers (which cost between $5,000 and $10,000 each) that can integrate Braille and tactile graphics. The items simultaneously render on a reader-accessible screen using our streamlined interface, and the student will be able to navigate to response spaces to provide answers.

The process of annotating (*tagging*) items for screen readers is an integral part of AIR's item development procedures as discussed in Section 7.3.3 of this proposal. After final item

Exhibit 7.3.11.2-1: Summary of Required, Preferred, and Additional Accessibility Features Available through AIR's Test Delivery System

Feature	Description	Required or requested in RFP	Available in system	Requires content annotation	Content annotation available in proposed item bank
Screen reader	Built-in text-to-speech, support for third-party screen readers. Reads text and describes other media on the screen. Third-party screen readers often drive refreshable braille displays.	yes	yes	yes	yes
Increased font size (large print and zoom)	Font size can be set in advance by a test administrator or authorized adult. Zoom buttons are available to students for individual items.	yes	yes	no	n/a
Font and background color (color contrast)	Configurable to support any combinations of font and background color desired including reverse contrast. Choice of background colors affects the colors that can be used in graphics, so we recommend that users stick with a small number of colors.	yes	yes	no	n/a
Assistive and adaptive devices	Technologies that mimic keyboard or mouse work out of box. Technologies that require the use of on-screen windows require that student accommodation be set by the test administrator.	yes	yes	no	n/a
English-to-heritage language dictionary	Translations can be tagged to individual words or phrases in passages and questions. Supported in any language.	yes	yes	yes	Smarter Balanced only; does not currently include Haitian Creole
English-to-sign language translation dictionary	American Sign Language supported as a full translation or tagged to a word/phrase as a glossary entry.	yes	yes	yes	no
English language glossaries	Definitions can be tagged to individual words or phrases in passages and questions.	no	yes	yes	Smarter Balanced only
Line reader	Can be configured to be available for passage reading.	no	yes	no	n/a
Expandable passages	Available for all passages. Allows students to expand passage to use complete screen. Temporarily covers up questions associated with passage, but minimizes scrolling when reading long passages.	no	yes	no	n/a
Print on request	Configurable for any student for passages and/or items.	no	yes	no	n/a
Mark for review	Allows students to mark an item for further review at the end of the test or testing session.	no	yes	no	n/a

content is approved by the client, the next step in our Item Tracking System (ITS) is for the items to move forward so they can be tagged for text-to-speech (which is used by sighted students) and text-to-Braille (which is used by visually impaired students). AIR has a team of experienced employees who work closely with our content staff to ensure that the items are correctly tagged to conform to any business rules set by our clients and provide the support that students need.

Increased Font Size (Large Print and Zoom). AIR's online testing system supports a variety of print sizes. We generally recommend offering five font sizes with the smallest size being the equivalent of 12- or 14-point font and the largest size being approximately five times as large as the smallest size. We will work with the Department to determine the specific size options offered.

The default size may be set prior to testing through TIDE, or may be set by the administrator at the time of testing through the TA Interface. Most test administrators are aware of which students need a larger font and set the font size in the TA Interface at the time the student is approved to test. Our student interface also includes "Zoom In" and "Zoom Out" buttons, so students who need a larger size for a particular item or graphic can control the print size themselves.

Font and Background Color (Color Contrast). AIR's testing system supports any combinations of background color and font color, including reverse contrast (white font on a black background) desired by our clients. However, in practice the color combinations chosen influence the choice of colors that can be used in graphics. For example, if Florida were to choose to offer students a blue background, graphics would need to be tested to ensure they display properly against that background and the use of blue in graphics would need to be limited. Therefore, we recommend deciding on a limited number of background/font color combinations at the start of item development and then tailoring graphics during item development so that they can be effectively displayed on the background colors chosen.

The SAGE item bank was developed to support the following color combinations:

- Black font on white background
- White font on black background
- Black font on rose background
- Yellow font on blue background
- Black font on blue background
- Black font on light blue background

Smarter Balanced items support these color combinations:

- Black font on white background
- White font on black background
- Black font on magenta background
- Yellow font on dark blue background
- Dark grey font on light grey background
- Black font on light blue background

We recommend that if Florida uses an existing item bank as the basis for these tests, Florida retain the color combinations for which the items were developed.

Assistive/Adaptive Devices. AIR's online testing system offers two interfaces: the standard interface, with which many assistive technologies work, and the streamlined interface, with which even more assistive technologies work. The streamlined interface is consistent with the principles of Web Content Accessibility Guidelines (WCAG) 2.0 and AIR is currently working toward WCAG 2.0 certification.

Assistive technologies that mimic keyboard or mouse activities generally work with the online testing system out of the box. Assistive technologies that use on-screen windows require an accommodation to be set because security protocols built into AIR's online testing system stop other windows from showing on top of the secure browser used for testing. "Permissive mode," which is built into our testing system, can be set for a student who requires an assistive technology that uses an on-screen window to allow the student access to the assistive technology while accessing the test in the secure browser.

English-to-Heritage Language Translation Dictionary. AIR's system supports glossaries that can be associated with individual words or phrases in a question or passages. The glossaries can provide a definition or translation or the tagged word or phrase. The availability of this feature is configurable by student.

Translations must be entered individually for each item, so tagging for glossaries is generally done at the same time as item development and tagging for screen readers. This allows a definition or translation to be tailored to the exact meaning of the word or phrase as used in the context of the question or passage. AIR's system can support glossaries in any language.

English-to-Sign Language Translation Dictionary. AIR's system is able to deliver sign language by displaying videos of people signing. While developing our sign language capacity we met with experts on sign language and advocates for students who are deaf. In all cases we were advised to use videos of actual people signing rather than signing avatars. Sign language stands as an independent language and the avatars are not currently capable of translating appropriately from English to American Sign Language (ASL). Furthermore, subtler aspects of the communication, such as facial expressions, are not present in the avatars. Therefore, we made the decision to offer our sign language capability through recorded sign translation.

AIR can provide sign language for an entire item or passage or for specific words or phrases using a glossary as described above. The challenge of using a glossary is that ASL is not a direct word-for-word translation of English. Therefore, if Florida decides to pursue the use of an ASL glossary rather than translating a complete question or passage into ASL, care will need to be taken to identify segments of English text that can accurately and meaningfully be translated into ASL.

7.4.0 Test Administration

7.4.0 Test Administration

AIR understands that the contractor is responsible for all aspects of test administration described in this section of the ITN. Below we provide detailed descriptions to our approach of each of the requirements of this section.

7.4.1 Pack and Distribute Materials

In this section we describe our proposal for packing and distributing test materials, including cost, data file transfer, and packing specifications.

Packing, Distributing, and Retrieving Arrangements and Costs

AIR and DRC will be responsible for all distribution and retrieval costs and guarantee that all test materials will be delivered in a timely and accurate manner. Accurate packing, shipping, and delivery of test materials are critical to the successful administration of assessment programs. AIR team member DRC is proud of its 30+-year history of providing accurate and on-time materials packaging, distribution, and retrieval for assessment programs across the country. DRC is committed to upholding this same level of service for the FSA. No school should experience a delay in its testing or reporting schedule due the inability of a vendor to meet deadlines or deliver error-free materials. Please see Packing, Distributing, and Receiving Materials below for additional information regarding DRC's ISO 9001:2000-certified materials packaging, shipping, delivery, and materials return processes, including identification of carriers.

Packing and Distribution Specifications for Each Test Administration

AIR and DRC will work with the Department to identify and thoroughly document specifications and business requirements for all processes, systems, applications, and deliverables that are developed for the FSA program, including those for materials quantity calculations, packaging, distribution, retrieval, inventorying, and processing. These specifications will be used by AIR and DRC as the basis for programming and developing Florida-specific systems and processes, as well as training Project Team personnel. A draft specifications document will be provided at the initial contract management kick-off meeting, along with samples of packing and inventory lists and memoranda. All requirements documentation will be in a Department-approved format and will be reviewed and approved by the Department prior to initiation of any project activity or task. As requirements change for a project phase or activity change, the documentation will be updated accordingly, so that a complete record of specifications is consistently available to all AIR and DRC Project Team members and the Department.

Number of Districts and Special Schools

AIR and DRC have reviewed the information provided in the ITN, appendices, and addenda regarding anticipated numbers of students, schools, and districts. We understand that these numbers will change throughout the life of the contract. DRC acknowledges that test materials will be shipped to approximately 80 separate sites, including districts and remote school sites, with most materials shipped to districts for distribution by the districts to their schools.

Distributing and Receiving Materials to Remote School Sites

DRC is experienced with working with states that have unique materials distribution conditions and requirements, including remote school sites, non-public schools, charter schools, special testing sites, and detention facilities. AIR and DRC understand that test materials may need to be shipped to up to 25 remote school sites not geographically located within their contracted school districts. The Department will provide AIR and DRC with a list of approved remote sites.

District and School List Data File

AIR and DRC are accustomed to working with states to obtain, receive, and maintain student, school, and district data files. AIR understands that the Department will provide us with data files containing a list of district and school names and identification numbers at the beginning of the contract. We will maintain and update the list throughout the contract and will provide a copy of the data file to the Department at the end of the contract, or upon request. AIR will provide this data file to DRC for incorporation into their assessment systems as appropriate. Please see Section 7.5.2 for more information on AIR's enrollment and student PreID systems and processes.

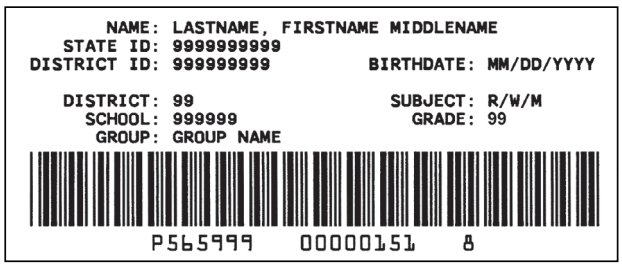
Production and Delivery of PreID Labels and Rosters

One critical aspect of our plan to speed the processing, reduce cleanup time, and improve data quality involves providing a mechanism for schools and districts to create "real-time-ID" labels for newly enrolled students. This process, described in detail in Section 7.5.2 will enable schools and districts to enroll students and print labels in near-real-time on stock that we will provide.

The real-time-ID process will eliminate the need for staff to grid student information onto test booklets, eliminating a big source of error. In addition, because all demographic and enrollment data will be captured before testing, district data cleanup can commence while testing is still going on.

Our real-time-ID process supplements a traditional PreID process, rather than supplanting it. Using student data files provided by AIR (see Section 7.5.2), DRC will print student PreID labels and rosters. Label information will include all information required by the Department, such as unique student ID number and barcode, student last and first name, school name and number, district name and number, grade and subject area, date of birth, gender, ethnicity, student classification data. DRC will use the same data files to produce student rosters in the same sort order used to prepare the student labels. DRC will ensure that the information contained on the student rosters accurately corresponds with student label information so that districts and schools can easily use the rosters to verify the accuracy of student label information.

Exhibit 7.4.1-1: Sample Student PreID Label Information



The PreID barcode will ensure that each PBT student response document returned to DRC can be unequivocally associated with only one record in the master PreID database. Exhibit 7.4.1-1 displays an example of the type of PreID information that can be printed onto a student label.

Upon receipt of the student response documents at DRC, the barcode number on the student PreID label will be scanned and validated against the master PreID database provided by AIR. The barcode corresponds to the PreID number and is human- and machine-readable.

Printing of the PreID labels will take place at DRC's in-house printing facility. Requirements and printed documents will be subjected to strict QA inspections throughout label production to ensure printing meets DRC's strict quality standards. These standards ensure scanning compatibility and accuracy. Print quality checks include text alignment and ink consistency, including the absence of smudging or flaking. The format and precision of the printed information will also be closely examined throughout production by DRC's software QA analysts to make certain the information is correct. AIR and DRC will provide the Department with production samples of student PreID labels for a quality review. Student PreID labels and rosters will be packaged and distributed with test materials during the second wave (TM2) to districts after the PreID window closes. Supplemental PreID labels and rosters will be produced and distributed to districts that update their PreID files during subsequent PreID windows established by the Department.

Student Mobility

AIR and DRC recognize the need to address student mobility. We propose an on-demand student label printing process (real-time-ID). This process will accommodate new students, permit student updates and corrections, and eliminate the need to hand grid student information on student response documents, thereby increasing the accuracy of student information.

District/school test administrators will be able to access AIR's Test Information Distribution Engine (TIDE) system to enter and/or update student information; please see Section 7.4.8 for more information on TIDE. Logic will be in place to determine whether the student exists in the main student database and already has a unique identification number; or will require a unique statewide ID number. The system will be set up to allow the user to produce on-demand student PreID labels and print them on local printers. The labels will be similar in layout and will contain the same student data as the student PreID labels printed and distributed by DRC, including unique document identifier barcodes. As labels are generated, assigned identifier barcodes will be recorded in the student database, which will be used to link the answer document during receiving and processing at DRC.

To help ensure print quality and scanning compatibility, DRC will provide blank student PreID label stock to all districts. AIR and DRC will work with the Department to determine blank label stock quantities that will be provided to each district. District and school personnel will be directed to use laser printers to locally print the student PreID labels to ensure optimum ink quality and prevent unscannable student labels due to printer or ink issues. In the event that DRC receives student response documents with unscannable student labels, DRC will access the TIDE system to generate replacement labels.

Materials and Quantities

AIR and DRC have reviewed the types, quantities, and packaging instructions provided in Appendix E of the ITN. Please see Appendix B of our proposal for our Materials List for the FSA.

Packing, Distributing, and Receiving Materials

AIR team member DRC has fulfilled packaging and shipping requirements for numerous large-scale assessment programs, including Alabama, Alaska, Louisiana, Ohio, Oklahoma, Pennsylvania, and South Carolina. DRC's ISO 9001:2008 certified distribution process underscores the importance of quality standards; DRC takes all necessary precautions to ensure accurate packaging and timely delivery of all materials. In 2012, DRC packaged and distributed more than 15.6 million secure materials.

Materials Packing

DRC will use its Operations Materials Management System (Ops MMS) for the packaging of testing materials. This proprietary system provides an accurate and efficient method for packaging materials. Systematic quality controls facilitate the tracking of secure materials throughout the packaging and distribution phase. Using scanners to "scan out" order-specific materials, Ops MMS provides the flexibility to package secure documents already preassigned to a site-specific level or to use barcode scanning to assign secure ranges at the point of packaging. All requirements provided by site-specific packing lists must be satisfied by these scans in order to complete the packaging process. These systematic controls ensure that the accurate quantity, material type, and security range is pulled and packaged for the appropriate site.

Through Ops MMS, DRC staff can view data on the items scanned into any box and compare this data to the physical box contents. Random boxes of packaged material are pulled, opened, and verified for accuracy against the contents listed in the system. All data generated in packaging will made available to the Project Management team, providing an adaptable tool for monitoring shipments and satisfying client concerns.

All test materials will be packaged sequentially in ascending barcode and box order. Each box will include a packing list that lists all materials in sequential packaging order. Materials will be shipped to districts and remote sites for distribution. Shipments will be packaged and shipped by district size, from largest to smallest. DRC understands that district size rankings will be updated each year by the Department. District shipments will be packaged by school and ordered using school numbers, or route code order followed by school number, if this packaging order is requested by districts.

Materials will be packaged and shrink-wrapped in set and subset quantities specified by the Department. DRC acknowledges that all secure materials must be shrink-wrapped, and that some materials such as test administration manuals will not require this type of secure packaging.

As specified in the ITN, distribution quantities for testing materials will include overages of 15% per district for PBT materials and CBT ancillary materials. AIR and DRC understand that districts may select from four distribution algorithms:

1. Entire 15% overage distributed to the district
2. Entire 15% overage distributed to schools
3. Overage split between district (10%) and schools (5%)
4. Overage split between district (5%) and schools (10%)

DRC will ensure that a sufficient number of copies are available at its facilities for any last-minute orders.

Boxes containing materials for use by districts will be labeled with the name of the district assessment coordinator and will be labeled on the top and all four sides. Boxes will be labeled with the box number and total number of boxes, e.g., "Box 1 of X." When materials for multiple administrations are shipped together, labels will be used to identify which boxes correspond to each administration. Each shipping box will be preprinted with DRC's return address and affixed with brightly colored labels stating "TO BE OPENED BY ASSESSMENT COORDINATOR ONLY." District and school boxes will be different colors so that they can be easily distinguished. Colored labels will be used to differentiate between boxes containing administration materials (e.g., packing lists, materials return kits, ancillary materials) and those containing testing materials. All school boxes will be labeled with the name, number, school test coordinator's name, address, and "Attention: School Test Coordinator" using at least 16-point font. Boxes containing secure test materials will never be labeled as such externally. AIR and DRC will work with the Department to develop labeling specifications.

For most shipments, DRC uses boxes with a minimum of 275 pounds bursting weight. Box size will vary to accommodate specific shipping demands but will be small enough to easily handle. All fully packed boxes will weigh less than 25 pounds and will conform to the dimensions provided in the ITN. DRC encourages districts to re-use these boxes for the return shipment but will send additional boxes to districts who request them. Return labels containing school and district information will be included to simplify the return process. Please see the subheading below, titled Materials Collection, Receipt, and Secure Check-In, for more information on DRC's materials return procedures.

Materials Distribution

AIR and DRC will be responsible for the cost of all distribution and retrieval to and from each district, and will guarantee that all test materials are delivered in a timely and accurate manner. We will also arrange for and cover costs associated with delivering materials to another district if delivery errors occur. In the unlikely event that such an error occurs, DRC will arrange for overnight delivery service for these materials. AIR and DRC acknowledge that the Department will not be responsible for the costs of schools shipping materials to their district offices, unless shipping is required to correct a packaging error. Distribution of test materials will not begin until final Department approval has been received via an Approval to Ship form.

For each shipment that contains more than one pallet, DRC will provide hard copy pallet maps that illustrate the identity and location of boxes on each pallet. Pallets will be organized to match internal district delivery routes if provided by districts; route code information will be collected electronically by AIR during the enrollment process and transferred to DRC for use with their packaging and distribution systems and procedures.

DRC works only with shipping vendors that provide online tracing and tracking services. For the Florida Standards Assessments, DRC will use United Parcel Service (UPS) and another leading national and global carrier, King Solutions, Inc. (King), for the distribution and collection of all assessment materials. DRC has used both of these carriers for other assessment programs with excellent results. Both of these carrier methods will allow cost-effective, traceable, and timely distribution of materials.

Test materials will be delivered in at least two waves per administration, with test administration manuals shipping in the first wave (TM1),

and test booklets, answer documents, student pre-ID labels and rosters, and other administration materials shipping in the second wave (TM2). Additional shipments may be required, specifically for the distribution of updated student pre-ID labels and rosters and additional materials. AIR and DRC will work with the Department to define the actual dates of each administration's shipping waves. Section 7.1.2 contains a detailed schedule that outlines preliminary delivery dates. DRC will notify all schools via e-mail regarding all shipments. DRC will ship all test materials directly to district offices. Delivery of materials will be scheduled during regular school hours, 9:00 a.m. to 3:00 p.m. Eastern Standard Time (EST), and will be scheduled to account for holidays and school breaks. Districts will be able to contact DRC directly to request alternate shipping schedules; all shipping change requests will be tracked internally to ensure timely and accurate completion.

All shipments will be designated as "inside delivery required." Signatures of receipt will provide proof of delivery and allow DRC and districts to track all shipments via UPS QuantumView™ and King's online tracking system. The Department will also have access to these online tracking tools if desired. District, school, and Department personnel will have the complete support of DRC's courteous and professional Customer Service team to assist with package tracking and the resolution of delivery issues. Please see Section 7.4.10, Customer Service for Paper-Based Tests, for more information on DRC's Customer Service function and process.

Upon request, AIR and DRC will provide the Department with a proof of delivery report, which will include a description of the materials, date and time of delivery, and the name of the staff member accepting the delivery, as well as information on any undeliverable materials.

AIR and DRC understand that proof of 100% delivery will be used for invoicing purposes.

AIR and DRC maintain our superior customer service reputations by making sure orders for additional materials, including additional accommodated materials, are shipped promptly. Should a school's enrollment change between the submission of its enrollment and the time of testing, the assessment coordinator can easily request these materials via AIR's online management system, TIDE. Requests for additional materials received after 3:00 p.m. in DRC's Central time zone will be processed the following business day. DRC will ship orders via secure, traceable overnight service for early-morning delivery to ensure materials arrive in time for testing. AIR will maintain a complete additional materials record and submit the report to the Department for review if desired.

Distribution of Miscellaneous Materials

DRC will be responsible for the shipment of any miscellaneous materials requested by the Department or districts. DRC will ensure that districts are informed of the carrier service, and that the carrier service uses properly identified vehicles and delivery persons. All shipments will be designated as "inside delivery," and all large shipments will be unloaded onto loading docks using carrier-provided equipment. DRC uses reliable carriers that are experienced with delivering assessment materials; carrier personnel will handle material deliveries and collections in a professional manner and will be directed to not leave the materials unattended or unprotected from the elements.

Packing, Delivery, and Receipt of Accommodations Materials

AIR and DRC understand that all printed special format accommodation materials will be clearly labeled and packaged separately from

regular print test materials. All special format materials will be delivered during the same delivery window as for all other test materials (TM2). DRC's receipt processes for accommodated materials require little document preparation by schools and districts. Unlike many testing companies, DRC does not require special packaging, return, and processing procedures for accommodated materials. Special format materials will be handled with the same quality and security procedures used with regular print testing materials.

Materials Collection, Receipt, and Secure Check-In

AIR and DRC will be responsible for all costs associated with the return of materials, including pre-paid return shipping from districts. DRC will provide all return shipping labels, prepaid postage labels, forms, instructions, and other needed materials in a Materials Return Kit shipped with testing materials in TM2. Districts will be encouraged to re-use their original shipment boxes for the return shipment, but DRC will send additional boxes to districts who request them.

DRC will use UPS Return Service (UPS RS) and King for the return shipment of Florida Standards Assessments testing materials, using the appropriate delivery method necessary to meet reporting deadlines. UPS and King use online tracking systems that provide the status of each shipment from the time it is picked up until it arrives at DRC's receiving facility. AIR and DRC will work with the Department to develop a materials collection schedule that provides adequate time for districts and schools to package materials, yet still enables on-time scoring and reporting. AIR and DRC understand that some districts will require additional pickups after their specified pickup dates, occurring for as many as 15 districts/500 boxes for each spring administration and 10 districts/200 boxes for each retake and End-of-Course administration.

DRC's materials return process is simple and straightforward. DRC's return procedures also offer many advantages to district and school test coordinators:

- AIR and DRC will provide a clear, well-documented return process in the test administration manuals, increasing the accuracy and decreasing the turnaround time of return shipments.
- DRC's customer service staff offers excellent support and has a history of providing superior service to school districts around the country. (Please see Section 7.4.10, Customer Service for Paper-Based Tests, for more information about this function.)
- DRC's receipt processes require little document preparation by schools and districts.
- Unlike many testing companies, DRC does not require special packaging or return procedures for accommodated materials.
- DRC's Ops MMS system enables 100% accuracy in accounting for returned barcoded materials.

Upon receipt at DRC, all returned boxes will be scanned in through its automated systems. Received materials will be compared against the shipper's manifest and testing site counts to identify any discrepancies, which will be forwarded immediately to project management for resolution. Please see Section 7.4.1, Materials Processing, for more information on DRC's materials processing systems and procedures.

Materials Return Errors

During materials receipt, DRC will document by school and district any errors made in packaging or returning test materials. The

error log will document any problems noted during materials return/check-in, based on Department requirements, and will include the date, district name, description of error, steps taken to resolve the issue, and other information as necessary. This error log will be provided to the Department within three weeks after the scheduled receipt of materials from all districts. DRC will contact districts and the Department to resolve any issues that cannot be handled during receiving and processing. AIR and DRC understand that these incorrectly packaged student response documents will be processed and scored under extended timelines, and that individual reports will be generated and shipped to the districts.

Materials Processing

Team member DRC achieves accurate and efficient secure materials receipt processes that require a minimal amount of document preparation on the part of schools and districts. The company's proprietary materials management system, Ops MMS, allows DRC to accomplish this goal. Its advanced automation and barcode scanners provide fast and accurate data collection with no dependence on materials/document order. This translates into time saved for assessment coordinators during materials return. Captured data are organized into user-friendly reports from the start of the secure materials check-in process, providing valuable insight into suspected material shortfalls as early as possible, and mitigating potential consequences of delay. DRC processes up to 250,000 received materials per day (box receipt, separating and sorting, and scanning secure barcodes). In 2012, DRC processed more than 13.1 million secure materials.

As evidenced by its ISO 9001:2008 certification, DRC maintains stringent quality-control procedures during the document receipt process. Log-in procedures, developed specifically for the FSA by DRC and approved by the Department, will provide clerical personnel with step-by-step instructions, sorting rules, priority/special processing procedures to be followed during the log-in process for assessment materials.

Ops MMS provides efficient and accurate control of all barcoded materials (including scannable documents) that are shipped from and returned to DRC for each test administration. The system allows DRC to track documents through all processing steps: Box Receipt, Materials Receipt, and Quality Control Rescan. The Box Receipt process is used to check in all boxes coming back from districts and schools. This flexible, automated process helps reduce the processing time. By scanning box labels, the Box Receipt process can be used to flag and drive priority, late return, or special handling processing. The Material Receipt process uses project-specific processing and sorting rules are systematically applied to increase sorting accuracy and efficiency. The process will begin by hand scanning the DRC box return label on each box. Each box is then opened and security codes, and precodes if applicable, are hand scanned to link each document to the original box. The system, based on project-specific business requirements, will guide the user to place the scanned materials in the correct staging location.

During the next phase, Quality Control Rescan, using streamfeeder automation, materials will be matched against scan information obtained during the Materials Receipt process. These materials will then be staged for further scanning and scoring processing (please see Section 7.5.0, for more information on scanning and scoring). Non-scannable materials also go through a similar scanning process to verify scan counts and final labeling before being sent to storage.

Given that materials processing occurs immediately upon receipt of assessment materials,

real-time feedback is provided on actual receipts versus expected receipts for schools and districts. In turn, the DRC will be able to contact any district regarding what appears to be an anticipated materials receipt "shortfall" as soon as the materials for the entire district are checked in. Secure materials issues can thus be identified and resolved well in advance of any reporting. OpsMMS also provides a flexible platform for which materials can be intercepted at the district, school, box, or individual booklet level if needed. DRC's processing system offers a tremendous advantage to the Department by providing quality control measures that are specifically related to potential test security issues. Problems can be caught early and resolved in a timely manner.

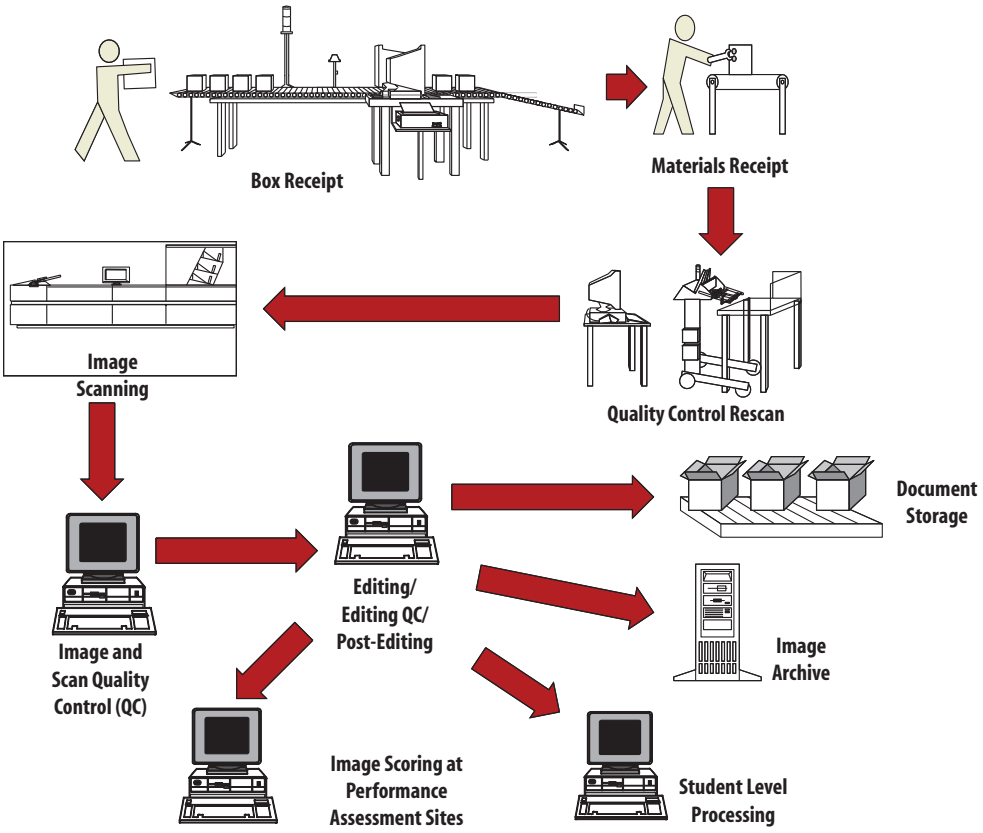
Exhibit 7.4.1-2 illustrates the overall workflow from receipt of materials through all processing of materials and the presentation of scanned images for scoring.

Summary Report of Returned Materials

AIR and DRC recognize that assessment security is of the utmost importance to the Department. DRC will provide the Department with a report of all secure materials received and checked in by DRC. AIR and DRC will work with the Department to define the requirements for this report including layout, format, and reporting fields.

AIR and DRC acknowledge that if DRC's barcode verification system is demonstrated to be unreliable, each document will be required to be scanned twice, creating independent data files that can be matched for scanning errors, and that manual checks of answer documents

Exhibit 7.4.1-2: Scannable Document Processing Workflow



will be required to ensure 100% accuracy of secure document check-in.

7.4.2 Missing Materials Report and Inventory

DRC has implemented several processes that will help ensure the security and tracking of secure materials. Because each secure material is imprinted with its own unique test security number, after booklet check-in for the entire project is complete, missing materials reports are accurately and readily produced. After all returned secure materials have been processed and scanned, including as many orphan and late-returned documents as possible, DRC will provide the Department with a preliminary missing materials report for review. Following the 10-day review and approval period, DRC will produce missing materials reports for affected schools. These reports will list missing documents by type, title, barcode/security numbers, grade, school, district, and other criteria required by the Department. DRC will ensure that the missing materials reports do not include materials that have been identified as soiled/destroyed. School-level reports will be delivered to district assessment coordinators along with a district-level summary and memorandum; a state-level summary report will be delivered to the Department. After district staff have located missing materials or confirmed that secure materials are not in the district, DRC will update the missing materials inventory with this information and produce a final Missing Materials Summary Report and submit it to the Department by the date specified in the Deliverables Schedule.

7.4.3 Disposition and Storage of Materials

After each test administration, DRC will inventory and store unused test and answer books, manuals, and other materials for a period of at least six months. DRC will also inventory and store 100 copies of each test and answer book for each administration throughout the life of the project. In addition, AIR will store digital records of the CBT assessments for each administration. AIR and DRC will store throughout the life of the project any materials that may be used for subsequent assessments.

Upon completion of processing, verification of the individual barcode numbers of all secure materials returned by the districts, and acceptance accurate results files by the Department, scannable documents will be boxed for security purposes and final storage. After an initial 120-day period, the used student response documents will be moved to an off-site secure facility. The documents, as well as electronic images and data, will be stored for two years. The storage system will allow efficient and easy retrieval of individual student tests within a short timeframe. Unused and used materials and electronic images and data will remain secure until written authorization has been received from the appropriate Department contact to ship or securely destroy test booklets or images and data. AIR and DRC will submit a letter to the Department requesting permission to destroy specific materials. AIR and DRC will submit certificates of destruction that describe in writing the specific materials and files that have been destroyed. AIR and DRC understand that it may be necessary to retain a small number of used documents for a longer time period due to Department security investigations and that these documents are expected to be shipped to a new contractor at the end of the contract.

7.4.4 Retrieval of Answer Sheets and Test Books

AIR and DRC understand that we may periodically be asked to retrieve used test and answer booklets from storage and individual student

response files from the CBT system, up to 1,200 per grade, per administration, per mode. These materials and files may be retrieved to fulfill a variety of purposes, including Department investigations or audit, manual rescores, or contractor error resolution. AIR and DRC will be responsible for all costs associated with the retrieval, review, and delivery of these materials to the Department.

After a retrieval request is received, DRC staff will initiate and monitor the retrieval process. Processed test booklets/answer documents can be retrieved quickly and efficiently because of DRC's effective document storage procedures. Additionally, AIR's CBT system and data file storage procedures allow for on-demand retrieval of specified images and files at the student and school level. The following DRC storage procedures will ensure the quick retrieval of used test and answer documents:

- Project-specific box labels will be created containing the following information, as applicable: unique customer and project information, materials type, batch number, pallet/box number, and the number of boxes for a given batch.
- Boxes will be stacked on project-specific pallets. Each pallet will be labeled with a list of all the batches it contains.
- Before each pallet is stored, a quality check will be performed to ensure accurate boxing and pallet content labeling.

After an initial 120-day short term storage period at DRC's processing facilities, used answer documents and used scorable test booklets will be stored in an off-site secure facility that is climate- and pest-controlled, allowing for the preservation of the documents. The documents will be easily retrievable using the above storage and organization procedures.

7.4.5 Innovative Product Design

AIR's graphic designers enjoy working with clients to develop custom designs that provide a common look and feel across a variety of media. Sometimes our designs are based on the natural environment of a state (e.g., we incorporate graphics of colorful Hawaiian flowers on our website and in our publications for Hawaii and a lighthouse in our products for Delaware) or the name of the test (e.g., for the Oregon OAKS test, we use a graphic of an oak tree, and for the Utah SAGE tests, we use a graphic that incorporates a picture of sage). We work with our clients to develop a style guide that specifies a range of preferred colors and fonts that work well with the chosen graphics. Our style guides also include guidance on formatting of publications (e.g., layouts for tables of contents, charts, graphics, etc.).

AIR can configure all of our online system access points so they reflect the Department's preferred look ("skins") and color themes. Additionally, any print materials will be designed with the same themes so readers instantly make the connection to Florida assess¬ments across mediums. We will make sure that each piece of information is professionally designed, intuitively organized, and consistently "branded."

Our dedicated team of professional technical writers, editors, and graphic designers will create and secure appropriate permissions and/or copyrights for all art, graphics, charts, and illustrations. Our designs will cover such things as administration manuals, assessment results reports, information and reference publications, user guides, and other materials. The design process we employ includes furnishing conceptual art, design development, and final cover designs for the Department's review, input, and final approval.

AIR's ground-breaking work for our user interfaces includes four main objectives around usability:

1. Backwards browser compatibility (as much as 10 years ago)
2. Forward browser compatibility including desktop and mobile support
3. Universal accessibility to people with or without disabilities
4. Lightweight graphic files and elements for optimized performance

When designing user interfaces, we allow for flexibility to accommodate the use of adaptive technologies. We strive for simple, consistent, and intuitive design so that the interface is easy to understand, regardless of the user's experience, knowledge, language skills, or current concentration level. We consider users using the slowest available Internet connection and the lowest screen size possible (such as a tablet). The systems for which we design need to be served up quickly, so we trim extra imagery and heavy graphics to serve up only relevant site information to the user. Imagery we use consists of a client ID/logo, a system name, and universally bound icons to inform the user and layout strategies to guide the user through the site. To speed up page load time, we eliminate extra calls to the server. We use CSS3 and HTML5 standards for modern browsers.

In addition, we take care to align the text on our user interfaces with the graphic design. Our technical writers always ensure that any text displayed on our interfaces, as well as related documentation (such as user guides), is technically accurate, clear, and concise.

Using the latest technology, AIR's Publications and Graphic Design Services staff produce a wide range of materials targeting various audiences. Team members include senior creative directors, graphic designers, desktop publishers, editors, and copywriters. We have extensive experience developing and delivering high-quality publications and presentations in a variety of formats and languages.

From proofreading to copyediting to original writing to graphic design, spanning production for both print and broadcast media, translation, and Section 508 compliance, our team members deliver products appropriate for both technical and nontechnical audiences. We have decades of experience in developing award-winning, research-driven creative strategies, campaign materials, and publications. Vitae of our design team members are included in Appendix A.

AIR takes as its mission the development of innovative products and systems that will keep our clients' assessment programs at the forefront of the field. We look forward to partnering with the Department to implement a product design strategy for Florida that ensures cohesiveness and a common look and feel to all documents and websites and that synchronizes the flow of information.

7.4.6 Printed Products—Administration

The following section provides detailed information about printed products AIR will develop for test administration.

7.4.6.1 Stages of Development of Printed Products–Administration

AIR has a proven record of developing a structured and effective process for producing error-free documents, including, but not limited to, test booklets, answer documents, administration manuals, training materials, interpretive guides, user guides, and other ancillary documents.

AIR will develop test administration materials that

- are fully customizable to include policies and procedures unique to Florida;
- conform to the Department's Test Administration Manual workflow process;
- are scheduled to ensure that there is minimal overlap with other test administration material under development;
- are designed in consultation with layout and graphic design experts to create a look and feel that reflects the newly created Florida Standards Assessment (FSA); and
- are reviewed and produced by accessibility experts to ensure that they are fully 508-compliant.

While AIR has extensive experience creating administration scripts and instructions in support of its Test Delivery System, we recognize that each state is different. Each state has its own test administration requirements that must be communicated to districts and schools. AIR will work closely with the Department to include its policies and proven procedures with which districts, schools, teachers, and especially students are familiar.

AIR understands and commits to the following requirements of the ITN for printed administration products:

- AIR will produce the first written draft and all subsequent versions of all materials and products developed for this project.
- Each review period will last a minimum of seven work days and will begin with the posting of an electronic version of the document to a secure website by 9:00 a.m. (EST) on the first day of review.
- Development and review of administration materials will be staggered to minimize the number of materials under review at the Department at any one time.
- AIR will propose a detailed materials development schedule for Department approval for managing the workflow and volume of documents to be reviewed in each seven-day period in a format approved by the Department.
- The production of TAMs will follow the review schedule of test books/answer documents or computer-based test forms by one round.
- AIR will deliver proofread documents following well-defined procedures to ensure that all drafts are checked by computer for spelling and proofread for accuracy by qualified proofreaders.

Test Administration Manuals

AIR understands and commits to the following requirements of the ITN:

- Administration manuals will be fully customizable to address the Department's requirements, including, but not limited to, test security procedures; statutes and regulations; materials handling; test administration scripts; and best practices that have been established by Department staff and are familiar to district and school personnel as well as students.
- For each year of the contract (summer and fall administrations), AIR will produce in print and post online the following TAMs:
  - One (1) English Language Arts/Literacy (ELA/L) and Mathematics manual for paper-based tests
  - One (1) ELA/L and Mathematics manual for computer-based tests
  - One (1) ELA/L Retake manual (beginning with the first retake administration in 2015)

  - One (1) End-of-Course (EOC) manual
- At a minimum, TAMs will address the following topics:
  - the Department's test administration policies and procedures
  - the Department's test security policies and procedures
  - scripts for all assessed grade levels/subjects
  - packing and returning materials
  - receipt and distribution of materials
- Instructions for special-format tests will include scripts necessary for accommodated testing (e.g., Braille, one-item-per-page, and others) and will be provided as separate addenda to the manuals.
- Computer-based manuals will include scripts for the practice tests.
- Test administration manual covers will be developed separately from the TAMs and will later be married to the final products. As mentioned in Section 7.4.5 (Innovative Product Design), AIR is prepared to support the Department in its efforts to brand and promote the FSA by providing personnel experienced in the areas of visual/graphic arts and document/software/web design.
- TAMs will be packaged (without shrink-wrap) and delivered to districts for each administration as a part the first test material shipment TM1, according to the specifications in Appendix E, Part 3 of the ITN.
- All manuals will be available in a Section-508 compliant electronic format within seven days of Departmental approval of the web-tagged files.

AIR will follow the specific review stages clearly described in Appendix G of the ITN.

The review sequence is consistent with AIR's quality assurance (QA) process followed for printed and electronic materials. AIR will follow the same general process for the development of all materials and adhere to the stages described in Appendix G of the ITN.

We divide the development process into two phases:

1. *A drafting phase,* during which we obtain agreement on the content and design of the document (this part of the process differs somewhat for test booklets, which were discussed previously). Appendix G of the ITN identifies the following two rounds that fall under the drafting phase:
   - *Department Manuscript Round/TAM Information Sheet.* At this stage, the Department identifies the prior administrations' TAMs to use as a starting point for the current manual; identifies high-level changes, additions, and omissions to the scripts and other sections to be included; and introduces known or potential policy updates.
   - *AIR Round 1.* AIR uses the markup of the TAM provided by the Department as well as the TAM Information Sheet to draft the manual. AIR updates the TAM with known annual changes, including new screenshots, and embeds queries to the Department for its consideration and input. While this document may be created using a design program, it is still considered a draft given the outstanding questions and placeholder text/images prevalent in this round.
2. A *production phase,* during which we produce the document to the specifications developed in the first phase, accommodate any final adjustments, and ensure that the camera-ready proofs are error-free. Appendix G of the ITN identifies seven rounds that apply to the production phase.

The drafting phase will begin with conversations with the Department, during which we will discuss issues of both design and content. Following these discussions and an exchange of materials, such as the Department manuscript, the TAM Information Sheet, and a revised style guide, AIR will begin to develop the draft. The specific form of the draft varies according to the type of material.

Like the Department, we view the drafting process as iterative. Especially with new materials, we understand that it is not possible to make all final decisions prior to a first draft. Manuals are produced over several weeks and annual policy changes or clarifications may not be finalized prior to the beginning of the production process. Additionally, new reviewers enter the process as documents approach completion, interactions among design or content elements can sometimes be unexpected, and sometimes a seemingly good idea at an early stage simply does not work. Therefore, we build in time for multiple drafts of each product prior to its entering the production process. During the drafting process, the Department will receive formatted documents, typically produced in MS Word or a similar program. These drafts, however, will not reflect the final formatting. The first blackline version of the document (Round 1), which results from the first iteration through our production process, is designed to reflect the final layout and formatting. This, too, is an iterative process, and we work collaboratively with our clients to ensure an error-free product.

Each document's content is fully drafted before it enters the production system. The Department must be assured of error-free production of materials. This is an area where AIR has had considerable success, though we strive for continuous improvement. Our production department is headed by Kara Prezocki, who brings over a decade of experience in publications management. The staff of the production department consists of senior editors, editors, proofreaders, graphic designers, and layout specialists. Every public assessment document leaving AIR goes through this department.

Our production processes include multiple editorial reviews, and each document must receive senior staff sign-off. For test materials, this will require sign-off by Sandra Durden, our proposed test development lead; Kevin Murphy, our proposed senior program manager or Meredith Durgin, our proposed project manager for Test Administration.

Exhibit 7.4.6.1-1 provides an overview of our editorial review process. (NB: Change references to Blackline to Round/Blackline)

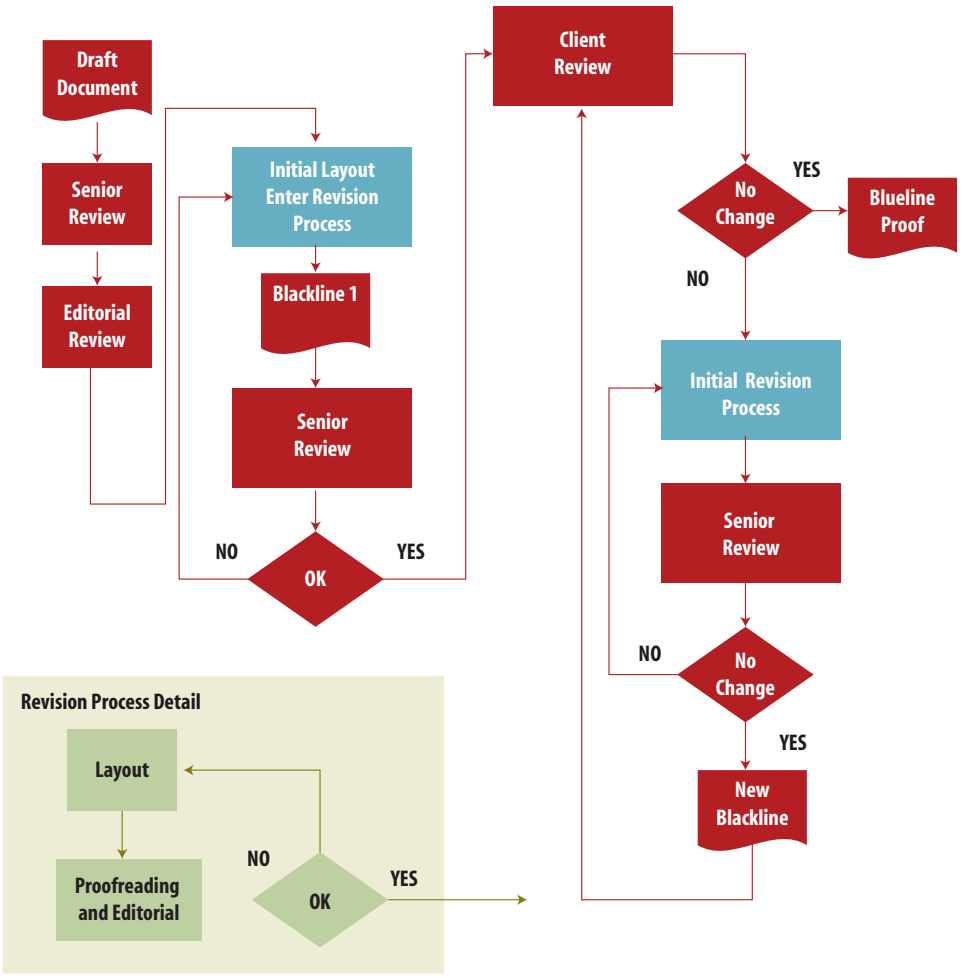
When the senior staff member overseeing the content is satisfied with the content, the document enters the production system; its first stop is an editorial review.

Upon completion of the editorial review, the document is formatted in a layout program, such as Adobe InDesign or QuarkXPress, or occasionally in other programs requested by our clients. The document is iteratively proofread and revised until the production department certifies the document to be accurate.

This step is followed by a senior review before the document is delivered to the client for review. In all cases, we will schedule at least seven days for the Department's review.

Camera-ready drafts are called blackline proofs. While up to four rounds are described in Appendix G of the ITN, each blackline is thoroughly proofread and reviewed for content accuracy. Many development steps described in the ITN that take place in later rounds should also take place in earlier rounds (e.g., verifying instructions, URLs, key dates) so that the best document possible is delivered at each stage. Doing so will lead to higher quality material that may be able to be approved ahead of schedule.

Exhibit 7.4.6.1-1: Editorial Review and Revision Process



All materials delivered will go through this process, ensuring that the Department will receive error-free materials for review and that any changes requested by the Department are implemented promptly and accurately.

As required, all manuals will be available in a Section 508-compliant electronic format within seven days of Departmental approval of the web-tagged files. AIR has extensive experience in providing assessment material in Section 508-compliant format. Specifically, for the Minnesota State Assessment, all test administration manuals (TAMs), user guides, technical reports, and several ancillary materials were converted to 508-compliant format. AIR's experience is documented in this section. AIR strives to adhere to the Section-508 principles from the very first iteration of a document, when possible, and to reduce the need for retrofitting the document and encountering unforeseen challenges downstream.

The Department's final round (i.e., final blackline) must have no changes, and it serves as the master document against which the blueline (printer proof) is evaluated. Each blackline after blackline 1 and the blueline are automatically compared with the immediately preceding version using a PDF-comparison tool that highlights all changes. This step has proved useful for identifying unintended changes made during the revision process. Such changes are difficult for humans to detect because they can appear anywhere in a document and may be subtle. The PDF-comparison tool highlights these changes so that each difference between versions can be mapped to an intended revision.

Section-508 accessibility requirements were enacted in 1998 as an amendment to the Rehabilitation Act of 1973. The regulations seek to ensure that people who have disabilities have equal access to all information provided by the federal government. Compliance with Section-508 web-accessibility standards became a requirement for all new and

redesigned federally owned or funded websites and materials posted or delivered through these websites launched on or after June 21, 2001. AIR is fully compliant with the provisions of Section 508 of the Rehabilitation Act, which require AIR to utilize Electronic and Information Technology (EIT) that is accessible to people with disabilities.

AIR is proud of its reputation for delivering high-quality, complete, and accurate Section 508-compliant documents to clients. AIR has developed and refined processes for (a) creating Section 508-compliant websites; applications; e-mails; videos; multimedia; PDF files; and Microsoft Word, Excel, and PowerPoint files; (b) testing and validating our work; and (c) performing QA checks. As a result, AIR is the "go to" contractor for creating Section 508-compliant materials and websites for several federal agencies—such as the Centers for Disease Control and Prevention (CDC), National Library of Medicine (NLM), and the U.S. Department of Education (ED). In several instances, we have remediated the accessibility work of other contractors, and we have trained federal clients how to create Section-508 accessible products.

AIR understands and has been through the website for the Section-508 clearance process for the U.S. Department of Human Services, Office of the Secretary, Assistant Secretary of Public Affairs (HHS/OS/ASPA), and many other government agencies. AIR is in a position to continue to apply our knowledge and experience with Section-508 requirements for web applications and documents for the Department.

Furthermore, AIR's work in usability testing continues a tradition of highly trained specialists applying their knowledge and skills to solving practical problems for clients. Our usability engineering staff consists of usability engineering professionals with strong training and experience in user interface design. We have conducted usability testing on numerous websites for our National Institutes for Health (NIH) clients, including a usability evaluation and redesign for the National Library of Medicine (NLM), usability and redesign of the National Heart, Lung, and Blood Institute (NHLBI) website, usability studies on Spanish-language websites, and a usability study (with blind users) for the NHLBI online live chat application.

7.4.7 Test Administration Ancillary Materials

The work will be completed by either full-time AIR or DRC staff under the direction of our project director, Kevin Murphy. The staff includes:

- Dee Wagner, AIR's corporate director for operations, will oversee the procedures to create all test administration. Ms. Wagner has more than 22 years of experience managing large, high-stakes assessment projects, including the past 13 years at AIR. Ms. Wagner has overseen test administration, security, and assessment operations, which include activities related to producing, delivering, receiving, scanning, and scoring test materials. A Six Sigma Black Belt and ISO-certified lead assessor, Ms. Wagner received hold both an M.B.A. and a bachelor's degree in operations management.
- Meredith Durgin, project manager, Test Administration, will lead the development of ancillaries for test administration, such as training materials and manuals. Ms. Durgin has 10 years of management experience in educational assessment, including managing multimillion-dollar projects. With AIR, Ms. Durgin has served as a senior manager for Oregon's very successful online testing project and has led smaller pro-

grams in Florida, Ohio, New Jersey, New Mexico, Texas, Missouri, Arkansas, Montana, and Utah.

- Peter Tressel, project manager, Paper-and-Pencil Operations, will lead the development of ancillaries related to handling paper, which includes kits, forms, and all of the various labels required for the paper program. Mr. Tressel has nearly 15 years of project management experience directly related to large-scale, statewide assessment programs, including overall management and direction for assessment programs in Minnesota and Ohio. In addition to his work in the testing industry, Mr. Tressel has more than 20 years of related experience with a variety of writing and editing projects and activities.

These lead staff will be supported by operations, editorial, graphic design, and production staff. Complete information on our staffing plan is presented in Section 7.7.2.

7.4.7.1 Training Resources for School and District Technology Coordinators (CBT)

In this section we discuss proposed materials and tools specifically for school and district technology coordinators to support computer-based testing (CBT) administrations. For a detailed discussion of AIR's proposed training plan where we outline and list training topics and timelines for Department and district personnel, please see Section 7.4.9.8.

AIR recognizes the importance of providing training materials for school and district technology coordinators to familiarize them with their roles and the online testing system. We will provide a webinar and PowerPoint presentation for school and district technology coordinators on preparing Florida schools' computer labs. This training includes information for school and district network administrators and provides guidelines for varied technical setup and technical support available at the schools. Technical setups include multiple secure browser installation methods, such as manual installation on individual machines, installation on machines through a network, access from a shared network drive, and thin-client setup. Minimum hardware requirements will also be reviewed in detail.

AIR will provide a webinar and PowerPoint presentation to train school and district technology coordinators on how to use the Test Information Distribution Engine (TIDE), which is discussed in greater length in Section 7.4.8. More specifically, technology coordinators will learn how to add users at the district and school levels so they can access appropriate online systems. The training also covers other TIDE functionality, including updating student test settings and setting test restrictions.

Our detailed user guide on system requirements provides information on the hardware and software needed for the online testing system. More specifically, the user guide discusses minimum hardware requirements for desktop computers, supported operating systems and web browsers, requirements for appropriate monitor display, and help desk contact information. AIR is committed to having a "small technology footprint" at the schools and districts; thus, part of this footprint is to be backwards compatible as well as forward looking. AIR realizes that inasmuch as schools and districts will have old systems, they will have new systems too. Thus, AIR's system is able to support a range of operating systems to support online testing.

AIR's secure browser, described in detail in Sections 7.4.8.3 and 7.4.9, is a special build of the Mozilla (Firefox) browser that is modified to protect the security of tests and support certain accommodations. Secure testing apps are available for mobile devices. In order for

students to take tests through the Student Interface of the online testing system, the secure browser or app must be installed. The secure browser installation instructions include information for downloading and installing the secure browsers on all computers that will be used for student testing. Downloading and installation instructions are also provided for different operating systems. All secure browsers can be downloaded from the Department information portal.

Our system has a built-in diagnostic tool that reports accurately the number of students who can be successfully tested. The diagnostic tool allows technology coordinators to run network performance tests to assess readiness for online testing. The diagnostic tool will check the school's network performance and text-to-speech settings, as well as verify the operating system. Online practice tests will also be made available, which use the same applications as the operational test site. This design ensures that all users become familiar with the online testing system before operational testing begins. User guides and systems documentation will be made available when the online practice tests open. The online practice tests will be available throughout each test window.

Technology coordinators will be provided with a user roles chart, which indicates, at a glance, the access each user role is permitted in each online system (please see the sample user role chart in Appendix D). System access for each user role will be reviewed in each webinar (discussed in Section 7.4.9.8) as appropriate. The user role chart will be posted on the portal; will be available in manuals; and will form part of the online, self-guided tutorials as determined in collaboration with the Department.

For additional information, technology coordinators can access FAQs on the Department information portal. Examples of questions that are answered on the FAQ page include:

- What do schools need to do technology-wise to get ready for Florida's online assessments?
- How many students can be tested at one time?
- How often is the secure browser updated?

Answers to these questions and many others will be provided to Department personnel on the FAQ page.

Exhibit 7.4.7.1-1 displays an overview of the materials AIR proposes to provide for school and district technology coordinators.

Exhibit 7.4.7.1-1: Proposed Training Materials and Tools for School and District Technology Coordinators

Proposed Training Material Topics	Proposed Training Material Format
Preparing Your School's Computer Labs: Learn about guidelines for technical setup and available technical support.	1. Webinar 2. PowerPoint
How to Use TIDE—Registering Users and Modifying Student Test Settings: Learn how to register users in TIDE, update student test settings, and set restrictions.	1. Webinar 2. PowerPoint
System Requirements Document: Learn about minimum hardware and software requirements for the online testing system.	1. User Guide
Secure Browser Installation Instructions: Learn how to download and install the secure browser on all computers that will be used for student testing.	1. User Guide
Checking Network Performance and Becoming Familiar with the Online Testing System: Learn how to assess readiness for online testing.	1. Diagnostic Tool 2. Online Practice Tests 3. User Guide
User Roles: Learn about the access each user role is permitted in each online system.	1. User Roles Chart 2. Component of the Webinar
FAQs: Learn answers to frequently asked questions from technology coordinators about the online testing system.	1. FAQ Page on the Department Information Portal

We assume that each webinar will be presented four times, with up to 100 attendees at each webinar. We propose to record the webinar and replay the recorded webinar during subsequent presentations. Each webinar will include a live question-and-answer session at the end. AIR will provide recordings of the webinars to the Department and will host them on the portal at the Department's request.

7.4.7.2 Instructions and Materials for Braille Tests

DRC and APH will produce Braille-version test administrator notes and scripts to supplement the test administration manuals for each subject and grade. If manipulatives are needed for Braille test items, DRC and APH will also produce these materials; DRC will ensure these items are distributed with the test materials to the appropriate districts. The production of these materials will follow the following the same production and Department review processes described in Section 7.4.6. The Braille notes and scripts will be distributed with the secure test materials. Information on APH and packaging and distributing special format tests is provided in Section 7.3.11.

7.4.7.3 Student PreID Labels

Using PreID files provided by AIR, DRC will produce and distribute adhesive PreID labels (3" x 3 ½") for each student that will participate in PBT assessments. Local school staff will affix the labels to student response documents. Please see Section 7.5.2 for more information on AIR's PreID process and Section 7.4.1 for information on DRC's procedures for producing and distributing PreID labels.

AIR and DRC will provide the Department with production samples of student PreID labels for a quality review. Student PreID labels and rosters will be packaged and distributed with test materials during TM2 to districts after the PreID window closes. PreID labels will be sorted and packaged according to the order specified by each district, with the inclusion of page breaks specified by each district and/or the Department. Supplemental PreID labels and rosters will be produced and distributed to districts that update their PreID files during subsequent PreID windows established by the Department.

AIR and DRC are proposing to address student mobility by recommending an on-demand student label printing process. This process will accommodate new students, permit student updates and corrections, and eliminate the need to hand grid student information on student response documents, thereby increasing the accuracy of student information. To help ensure print quality and scanning compatibility, DRC will provide blank student PreID label stock to all districts. AIR and DRC will work with the Department to determine blank label stock quantities that will be provided to each district. District and school personnel will be directed to use laser printers to ensure printing and scanning quality.

7.4.7.4 Student PreID Rosters

Using the same PreID files provided by AIR for producing PreID labels, DRC will produce and distribute PreID rosters. The information contained on the student rosters will correspond with student label information so that districts and schools can easily use the rosters to verify the accuracy of student label information, with one row of information provided per student. AIR and DRC will work with the Department to determine roster format and layout, with the understanding that 8 1/2" x 11" paper size is preferred, with the possibility of increasing the size to 8 1/2" x 14" for readability.

AIR and DRC will provide the Department with production samples of PreID rosters for a

quality review. Hardcopies of rosters will be packaged and distributed with the PreID labels and test materials during TM2 to districts and via AIR's online management system, TIDE, after the PreID window closes. Supplemental PreID labels and rosters will be produced and distributed to districts that update their PreID files during subsequent PreID windows established by the Department.

Please see Section 7.5.2 for more information on AIR's PreID process and Section 7.4.1 for information on DRC's procedures for producing and distributing PreID labels and rosters.

7.4.7.5 Document Count Form (DCF)

AIR and DRC acknowledges the requirement for a document count form (DCF) (i.e., header sheets) as outlined in the ITN. However, we would like to propose an alternate process that would not require header DCFs and takes advantage of the efficiencies in DRC's proprietary Ops MMS, while also saving district personnel considerable time. This process is based on the information contained in the student PreID labels and the ability to link the labels to school and district.

To provide additional assurance to district and school personnel that their student response documents have been received and processed, DRC will also provide weekly answer document status reports for schools and districts to verify receipt of student response documents. The status reports will be available to assist district assessment coordinators with tracking returned student response documents and will be used to identify any discrepancies that might exist between the district records of what was returned to DRC and DRC's records of what was received. Student response documents can be tracked through TIDE by student name after scanning at DRC. DRC will provide weekly updates in TIDE throughout the processing and scanning phase.

Based on experience, DRC finds that DCFs/header sheets can often be inaccurate sources of important group identifying information. DRC has implemented this alternative process with many of its state assessment clients with great success. These clients have never returned to using DCFs or headers after the switch to this alternative process. In fact, DRC finds that testing coordinators are thrilled with the procedural change as it makes the process for returning materials much easier and more efficient. For a full description of DRC's materials handling process using Ops MMS, please see Section 7.4.1.

If upon further discussion of our approach following contract award, the Department would still like to use DCFs for processing, AIR and DRC are prepared to provide the Department with the related costs.

7.4.7.6 Administration Record/Security Checklist

DRC will provide Administration Records/Security Checklists for schools/districts pre-printed with security barcode numbers for all secure materials, listed in ascending order by material type. The forms will provide space for districts to document materials assignment and receipt after testing. It will be the district assessment coordinator's responsibility to disseminate the test security information as appropriate and collect completed forms after testing. The purpose of these forms will be to ensure compliance to the established test security procedures. AIR and DRC will work with the Department to determine the format of these forms but understand that they must include box numbers and section breaks between packages. Forms will also be provided electronically in an editable format to districts via AIR's TIDE system.

7.4.7.7 Comment Forms

AIR will work with the Department to gather feedback on the program from key participants. These data can serve in both a formative role, as we strive to continuously improve the FSA, and an evaluative role, to inform judgments about how the program is working in the field.

Gathering Feedback from All User Groups

We will largely collect this feedback by conducting surveys of all user groups who will participate in preparing, administering, and taking the Florida standards assessments:

- **Test Administrators**
- **School Coordinators**
- **District Coordinators**
- **Technology Coordinators**
- **Students**

AIR will create these survey forms in partnership with the Department. They will be customized to type of user as categorized above. A sample set of questions for technology coordinators is shown in Exhibit 7.4.7.7-1.

In addition to some easily aggregatable closed-ended questions, each feedback form will include open-ended questions that will invite comments from participants.

Particularly for students (who make up the largest user base), we can encourage respondent feedback by creating survey questions that are appropriate to their reading age and length. Thus, we can customize the surveys by having a different one for elementary (grades 3–5), middle school (grades 6–8), and high school (grades 9–12) levels. A sample set of questions for high school students is shown in Exhibit 7.4.7.7-2.

Building Fully Customizable and Dynamic Surveys

We propose to use a survey tool called *Key Survey*. It allows us not only to customize the look and feel and the survey content, but to also dynamically integrate with AIR's other systems. Specifically, Key Survey has these main characteristics:

- Customizable look and feel—which will match the Florida look and feel chosen for the Assessment Program
- Skip logic—which lets respondents skip non-applicable questions
- Piping—which allows us to pull answers from one part of a survey into another
- Preview and testing capabilities—which allow us to preview and test the survey before publishing it
- Question, image, and media file libraries—which allow us to access particular images or media files (perhaps for younger students) to further customize content

Integrating with TIDE and RTS

Key Survey also has an API service that allows AIR to interact directly with their platform. This will allow us to integrate our user management and enrollment database directly with their survey tool. These include the following:

- Having one common source of all user and student enrollment data, and dynamically getting the latest data from AIR's Roster Tracking System (RTS)
- Using demographic data identical to the data already in the RTS, such as gender, date of birth, or ethnicity
- Transparently creating and managing users, including their roles and permissions

Exhibit 7.4.7.7-1: Sample Set of Questions for Technology Coordinators

Questions for Technology Coordinators

How did you download and install AIR's Secure Browser on the student machines?
- I installed it on each individual computer.
- I pushed the browser through the network.

How easy was setting up AIR's Secure Browser?
- Very easy
- Easy
- Difficult
- Very difficult

Exhibit 7.4.7.7-2: Sample Questions for High School Students

Questions for High School Sstudents

How often did you use a computer for school learning, for example, working on a homework assignment or researching a topic?
- Every day
- 1 or 2 times a week
- 1 or 2 times a month
- Not often

How did you feel about testing on a computer or mobile device?
- Very satisfied
- Satisfied
- Not satisfied
- Completely not satisfied

I have done my best quality work on this test.
- Yes
- No

- Possibly creating new tasks based on survey responses (for example, a student who wrote certain inappropriate words may trigger an alert in our system)

Fully Accessible and Available

All forms created in Key Survey will be accessible to responders from anywhere and anytime, whether the user uses a desktop, mobile phone, paper, or is even offline (the tool allows a user to complete a survey offline and upload his or her responses when the connection is restored).

We do not intend to collect any sensitive information on the comment forms. However, we note that Key Survey also has state-of-the-art security to ensure data is protected by taking the following precautions:

- It hosts data in SAS 70 Type II certified data centers that provide the highest level of physical security combined with failover and redundancy techniques.
- Data reside securely on database servers behind multiple firewalls.
- Confidential data are secured through an encrypted connection.
- Key Survey is an official licensee of the distinguished TRUSTe Privacy Seal Program and certified by the EU Safe Harbor Privacy Program.

Compiling and Reviewing the Data

The Key Survey tool enables AIR or authorized users to export the data into CSV, Excel, or PDF format, or even directly to a database. AIR can provide the Department with a complete raw data file (in any of the formats above) containing all responses.

After periodic survey collections (agreed on by the Department), AIR will produce statistical reports by user group.

7.4.7.8 Return Shipping Labels

DRC will provide and distribute preprinted, adhesive, color-coded labels to districts for use in returning materials.

7.4.7.9 Materials Return Kit—District

DRC will provide and distribute materials return kits (envelopes) to districts. These kits will contain return shipping labels, bills of lading, return instructions memorandum, and Braille notes and scripts (if applicable).

7.4.7.10 Materials Return Kit—School

DRC will provide and distribute materials return kits (envelopes) to districts for distribution to schools. These kits will contain document count forms (if the Department chooses to use this method instead of AIR/DRC's proposed alternative), paper bands, and color-coded return shipping labels.

7.4.7.11 Miscellaneous Return Materials

DRC will provide and distribute all materials necessary for packaging and returning all test materials to DRC for processing and scoring. Unlike many testing companies, DRC does not require special packaging, return, and processing procedures for accommodated materials. Special format materials will be handled with the same quality and security procedures used with regular print testing materials. Districts will be encouraged to re-use their original shipment boxes for the return shipment, but DRC will send additional boxes to districts who request them.

7.4.7.12 Paper Bands

DRC will produce adhesive printed paper bands (4" x 24") that will be used by schools and districts to bundle scorable materials. DRC will ensure that the bands are constructed so that adhesive does not stick to and damage the enclosed documents. AIR and DRC will work with the Department to define the paper-band specifications but understand, at a minimum, the bands will be printed on one side in order to identify the type of answer document contained in the bundle and that bands must be 8-point Carolina paper (or approved equivalent). The paper bands will also be compatible with multiple pen-and-pencil types so that required information can be written on the bands without smearing or smudging.

7.4.7.13 Rulers/Manipulatives/Calculators

Mathematics items developed for SAGE that require length measurement already have rulers embedded in the graphics. Standards 3.MD.4 and 4.MD.4, in particular, will include items in which students must measure items to the nearest fractional inch. Because the rulers are embedded in the graphics, teachers do not need to distribute a supply of rulers to their students. Paper/pencil forms for these items will include the rulers embedded in the graphics to allow students to measure objects in inches. Furthermore, items developed for SAGE that require students to measure angles already have protractors embedded in the graphics. Standard 4.MD.6 specifically requires students to measure angles using protractors. Paper/pencil forms for these items will also include the protractors embedded in the graphics to allow students to measure angles to the nearest degree.

Mathematics items developed for SAGE do not require the use of any special manipulatives by students. Instead, graphics have been included in items where appropriate to the language of the standard. For example, Standard 6.G.4 requires students to use nets for problem solving related to three-dimensional shapes. These items will include the net as a graphic in the stem, or they will require students to construct (or identify) the net as their response.

The SAGE assessments do not allow calculators for grades 3, 4, and 5. The Common Core State Standards in these formative grades depend upon students developing their numeracy and procedural fluency; thus, calculators are not permitted in these grades. In grade 6, a basic four-function calculator is allowed for one segment of the test, as identified by the Content Standards of the blueprint. In grades 7 and 8, a basic scientific calculator is allowed for the entire test. In algebra I, geometry, and algebra II, a scientific calculator with optional graphing and/or regression features may be permitted.

For paper/pencil forms, students may bring in approved calculators based upon the calculators for the equivalent online versions. [Reference http://www.fldoe.org/ese/pdf/CBTAccomm.pdf.] The reader is directed to Section 7.3.0, *Tools Available in the Testing Environment*, for further detail on the functionalities provided by AIR's calculators for online tests.

Using print-ready files provided by AIR, DRC will produce all required manipulatives, such as rulers and protractors. DRC will also provide large print and Braille versions of the manipulatives as necessary.

7.4.7.14 Miscellaneous Memos, Forms, Labels, and Other Products

DRC will produce and distribute to districts all necessary ancillary materials needed to support successful PBT administration, including miscellaneous letters and memoranda; packaging and shipment cover memoranda; packing lists; pallet maps; and other miscellaneous memoranda, labels, forms. AIR will provide these materials, as appropriate to districts in electronic format. AIR and DRC will work with the Department to define the content and format of these supplemental administration materials.

7.4.8 Online Management System

AIR's Test Information Distribution Engine (TIDE) provides an integrated system for

- gathering and managing student enrollment and preID labels;
- gathering and adjusting data about students, including student relationships (to their districts, schools, teachers, classes and/or programs), demographics, accommodations, or needs; and
- ordering materials.

This centralized assessment management system supports both online and paper tests. This year, AIR and DRC are introducing a new service: real-time ID. Florida schools and districts will be able to register students only one or two days in advance of testing for *both online and paper* testing to accommodate newly entering students. For paper tests, schools will be able to print an individualized, barcoded, student-specific "preID" label instead of bubbling information on a form. The scannable labels can be printed using any laser printer on label stock to be delivered with the preID'd answer booklets. This reduces work in the schools and districts, increases security, and improves data integrity. Real-time ID speeds reporting by eliminating most of the post-testing cleanup that occurs when schools must hand-bubble information for late-arriving students.

Real-time ID will supplement preID, not replace it. Real-time ID will only be used for students without preID books. "preID" or enrollment uploads may come directly from the Department or from individual districts. This would be at the Department's discretion. If the Department is able to collect near-real-

time data from districts, central delivery will help ensure the integrity of their statewide student information system and drive data improvement. If the mechanisms are not in place, we can accept uploads directly from districts.

TIDE, as well as all other AIR systems, will enforce strict authentication policies that meet the Department's requirements. TIDE adds, edits, and deletes users and sets them with different authorization based on roles. Since role creation is configurable, AIR will work with the Department to define a sufficient number of differentiated roles to support workflows at the schools and districts throughout the state. Authorized users can upload or enter

- user logins, passwords, and other (configurable) attributes;
- student information, including demographics, required accommodations for each test, and student relationships to classes, schools, and other entities in the system; and
- roster information defining classes, schools, and other relationships.

TIDE also offers an interface to input information about students or other users directly. Users have the option of dropping preID files into a secure AIR directory that is automatically monitored. The system periodically scans the directory for new files. The system scans the file to evaluate its format. Errors in the input file are reported back via a transaction receipt left in the watched directory.

TIDE allows school, class, and other information to be uploaded by the state, districts, or schools. This relationship information defines, updates, or deletes information about how the various entities in the system (schools, classes, teachers, students) are related to one another. The system enables users to create multiple rosters for each student. The reporting system reflects the rostering in TIDE and can report on classes or other rosters defined there.

With our system the tedious creation of testing sessions is a thing of the past. Test Administrators (TAs) create a testing session at testing time with as little as two clicks of a button. By logging in with a reference to the session number, students effectively request admittance into the session. Upon admittance (which the TA does from his or her workstation), the student is automatically added to the session roster.

When students log on to a session, they are offered a choice of test to take. Each student sees an individualized choice of tests

- for which he or she is eligible;
- for which the student has not exhausted his or her opportunities; and
- that the Test Administrator has chosen to offer in the session.

Data collected in TIDE are also used to determine student test eligibility for online and paper tests and serve as the source of data for preID labels.

Throughout the testing window, demographic and other data can be reviewed and corrected in TIDE, speeding the process of data cleanup, shaving weeks off the time needed for reporting.

Assessment coordinators can order materials through TIDE. Like our other systems, TIDE is highly configurable. For example, TIDE can be configured to

- create default orders based on historical orders;
- flag unusual orders for state review;
- provide default overages at the school and district level; and

- allow ordering by school personnel, district personnel, or both.

TIDE supports multiple ordering windows and allows tracking of materials after they are shipped. The system also provides a conduit for distributing online documents, forms, and other ancillary materials.

7.4.8.1 Test Staff Contact Information

TIDE maintains district, school, and staff information by storing user information, which is configurable, and can be easily searched, filtered, or exported. TIDE stores the user's school, district, and state association, and the user's role based on his or her security authorization level. This information can be exported and printed.

TIDE also allows easy editing of existing user information or adding of new users. The system stores information on when a user was added. Start dates on when a user was added can be shown on the UI needed. Additionally, we can tell when a user logged in to the common login system, which allows a user to log in to any one of the systems (excluding ITS) and access any other system for which he or she is authorized. AIR will work with the Department to define a sufficient number of differentiated roles to support workflows at the state and in schools and districts throughout the state.

7.4.8.2 Test Staff Passwords

Login information generated during user addition is communicated securely to the individual users. Passwords are not e-mailed to users. Instead, upon addition to TIDE, users are sent a secure link, one that expires after a configurable time, to a site where they set their password. Passwords in the TIDE databases are encrypted.

7.4.8.3 Test Session Requirements

Creating and Managing Test Sessions

AIR recognizes that the testing process is managed by educators and that every minute spent on administrative tasks is a minute taken from educating students. Therefore, we have designed a testing process that minimizes the administrative and technical burden on school personnel. We do this through

- implicit registration; and
- automatic session construction.

Implicit Registration

Implicit registration means that students do not need to be explicitly registered for a testing session. We have eliminated the clerical task of assigning students to sessions. Instead, at the time of testing, the TA starts a testing session with as few as two mouse clicks. The system assigns a session ID, and student login is simply a request to enter a session. Students log in with identifying information and the session ID. From his or her workstation, the TA authenticates the students and admits them to the session. In this way, the roster of students to be tested builds itself as students log in. Nobody has to sit at a computer creating these rosters.

Implicit registration is supported by our data exchange process, which is detailed in Section 7.5.2. Through completely automated systems, student information systems exchange information with our systems, so that each student is known to the system. Student eligibility to take a test is determined implicitly through a series of configurable rules. For example, a simple eligibility rule might state that students who (a) are in grade 5 and (b) have not taken a grade 5 math test are eligible to test.

Automatic Session Construction and Session Management Tools

Test Administrators use the TA Interface to create and manage test sessions. The interface allows authorized TAs to administer test sessions, monitor activity, and respond to test-related issues in one convenient location. The secure interface helps ensure that the right student is taking the right test and lets the administrator focus on test administration. As with paper tests, the TA's primary role with online tests is to ensure the security of the test and make sure that students have a quiet environment, free of distraction, in which to take the test. The security of the test is managed through a simple interaction between the TA and the students, as summarized in Exhibit 7.4.8.3-1. Students can test only when the TA is logged on and has a session active. After a student pauses a test, the TA must re-admit that student to the session.

Creating a Test Session

Test Administrators create a session simply by selecting the tests that will be available in the session. When students join the session, they can select from among the tests that (1) are offered in the session and (2) they are eligible to take.

Students use the session ID to log in to a test session. Session IDs are unique to each test session. When a student enters the session ID, the system links the student requesting access to the test session to the TA, who then approves or denies the student's access request. When students join a session by logging in and entering the session ID, the TA verifies their identity and admits them to the session.

Once admitted to the session, the student is given a final chance to confirm that he or she has requested the correct test. Upon confirmation, the test begins.

Reviewing and Approving Test Settings

During the authentication process, TAs have an opportunity to review or adjust the "test settings." Test settings include any embedded supports or accommodations to which the student may require access. These can, and should, be set in advance in TIDE; however, we recognize that schools do not always accomplish this in advance. Hence we make it possible for TAs to assign some or all accommodations as well (at the discretion of the Department).

The availability of access features, embedded supports, and accommodations is completely configurable. The Department will be able to determine whether TAs can adjust settings at the beginning of the session or whether access to specific features requires higher level authorization. For example, one state provides TAs with broad authority to adjust most features, but only authorized state users can authorize the read-aloud of reading passages. Exhibit 7.4.8.3-2 shows our online interface through which TAs review or adjust individual student accommodations before approving a student for a test.

Monitoring Students and Other TA Tools

Once testing begins, the TA can monitor student progress and, if necessary, stop one or all students from testing. The system is designed to automatically notify a TA of events that require an action on his or her part. For example, students with the appropriate accommodation may want to print a passage, and such requests alert the TA to print the passage. Exhibit 7.4.8.3-3 shows the TA interface during an active test session with five approved students.

Exhibit 7.4.8.3-1: Starting a Secure Test

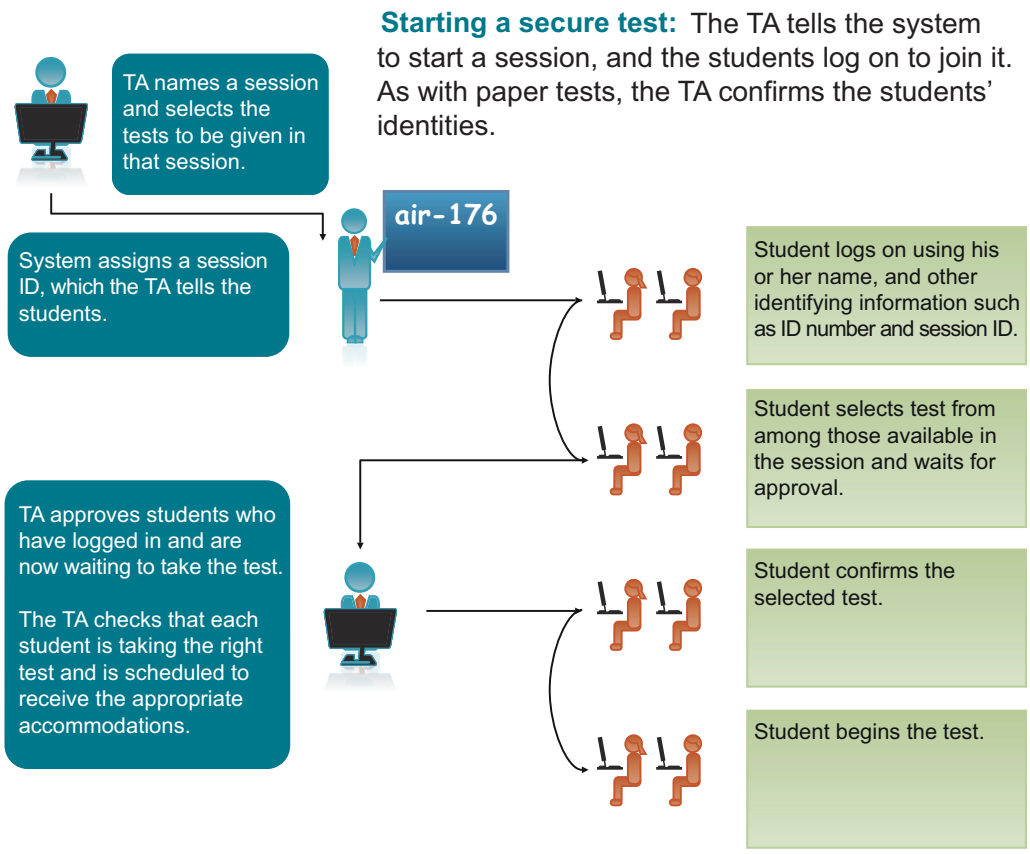


Exhibit 7.4.8.3-2: Adjusting Accommodations for Individual Students

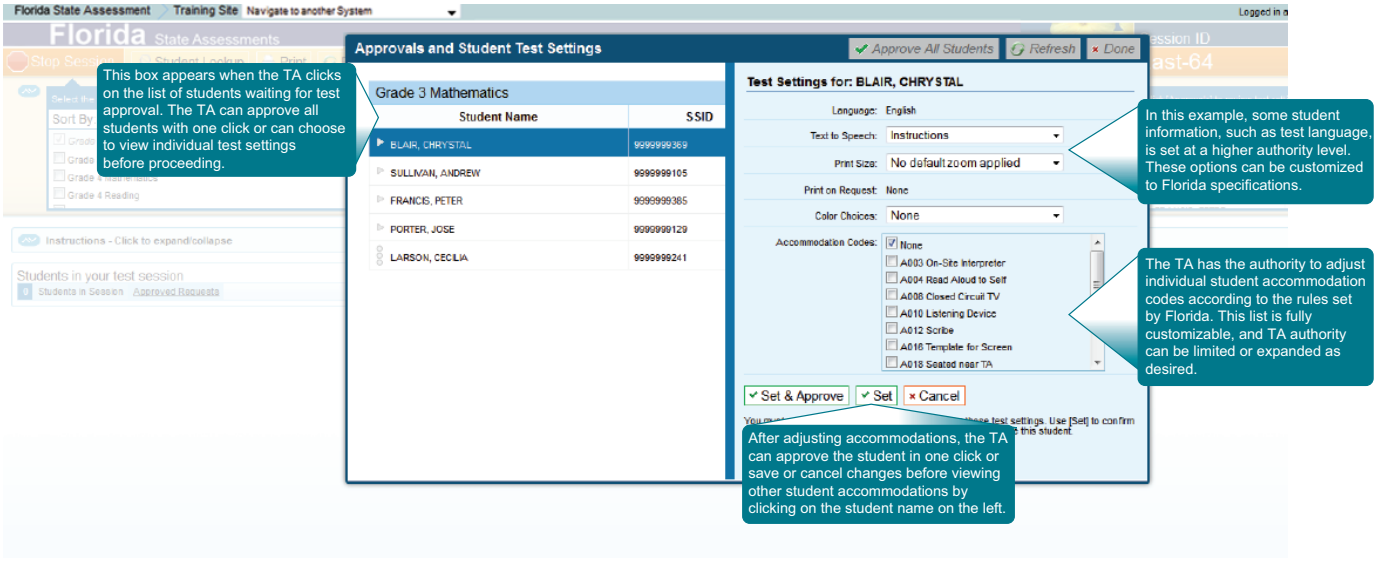

Exhibit 7.4.8.3-3: Test Administrator Interface During an Active Session

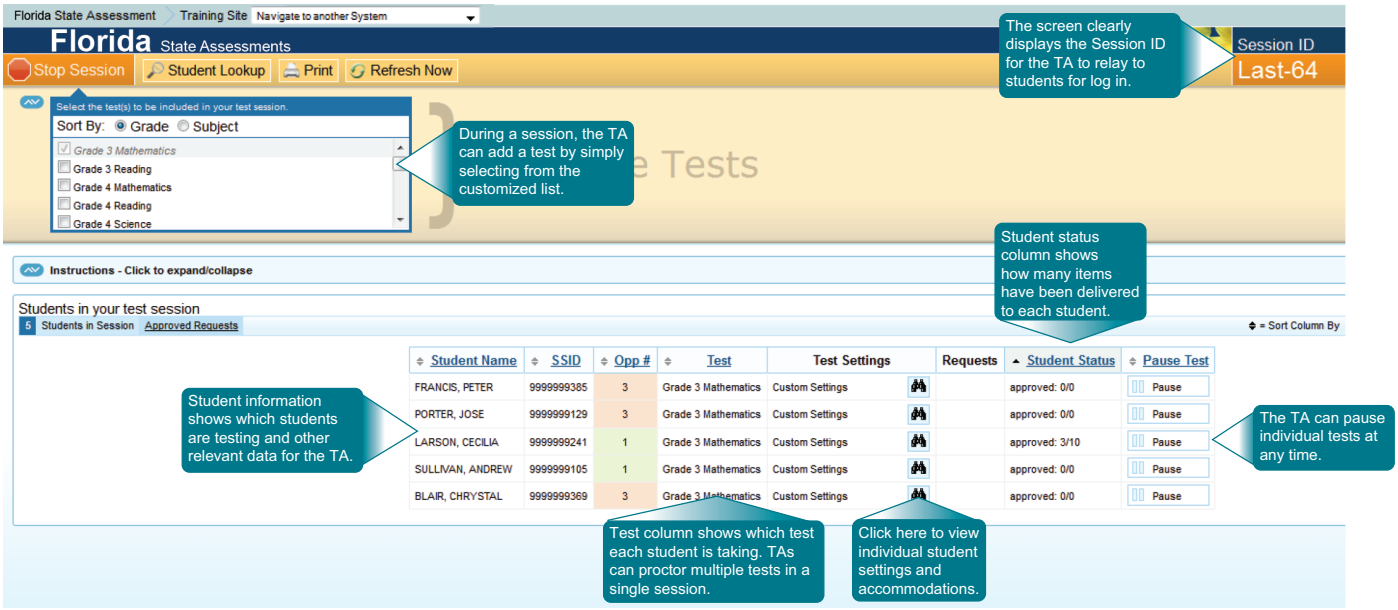

During an active test session, the TA can add tests to offer in the session. This feature is useful, for example, if a student joins a testing session to make up or complete a test that had been offered at an earlier time.

The list of students currently participating in the session shows the TA who is actively testing, which test each student is taking, and how many items have been delivered to each student. The TA can also view approved individual student accommodations by clicking the binocular icon, and he or she can pause and restart individual tests or the entire session at any time. Student actions that require TA intervention appear in the "Requests" column. For example, our secure print-on-demand feature prompts the TA for authorization to fulfill the request and to retrieve the paper from the authorized printer.

Search Feature

We have built two types of searches to help Test Administrators look up students who may have trouble logging in to the test or for other data-related issues.

1. Quick Search – If a student is having trouble logging in, a TA can use the Student Lookup feature to search for that student by the statewide student ID.
2. Advanced Search – A TA can also search for students by looking up a district, school, grade, or name.

Alert Feature

The TA Interface has an alert mechanism that enables the Department to push messages out to all TAs currently logged in to the interface. This is shown in Exhibit 7.4.8.3-4.

Exhibit 7.4.8.3-4: Alert Mechanism

Fully Configurable TA Interface

The Interface is designed to be fully configurable, and we will work with the Department to set it up according to their specifications. Exhibit 7.4.8.3-5 shows a list of what the Department can customize.

Automated Backup, Recovery, and Restart

AIR has developed a system that includes three innovations not found in other systems: automated backup, recovery, and restart; Internet-based solution; and multi-fault tolerant design. AIR's system is based on a real-time, distributed Internet technology, without the need for caching servers or other burdensome technology in the schools. The system is fault tolerant, with redundant hardware at every point. Interrupted tests can be resumed immediately without additional support or intervention. Interruptions in Internet service or computer failures do not lose data, and students can resume testing where they left off when service is restored. Industry standard backup and recovery procedures are in place to ensure the safety, security, and integrity of Florida's data.

Pure Internet Solution

Our pure Internet solution also reduces the burden on schools. Our system has no need for proctor caching or local caching servers. Such caching mechanisms require extra hardware at schools, intermittent reinstallation, and a higher level of technical support. Our system is purely Internet-based, robust, and nearly maintenance-free. Before the beginning of the school year, schools install our secure browser. The secure browser is simply a special build of the Mozilla (Firefox) browser that is modified to protect the security of the test and support certain accommodations. It can be installed from a network on many machines, or it can be individually installed. We can even offer installation that does not require administrative rights. Once the browser is installed, it generally does not change throughout the school year. Changes or updates to the test happen on our servers and are transparent to the schools.

The pure Internet solution is robust. Every time a student answers a question, the response is saved to our servers. For longer responses such as essays, the system can be configured to save periodically (say, every minute) or whenever the student presses the "save" button. If the system is unable to reach the server, the student is stopped from testing, so no work is lost. The system is designed to make multiple attempts to reach the server, so even if connectivity is temporarily lost, no work is lost. Often, the connection will be reestablished without the student being aware that it was ever lost. Caching occurs on the students' machines (in memory, not on disk) in real time. This ensures a seamless testing experience in which students typically see no delays between items.

Contrast this approach with systems requiring caching servers. The caching servers sit in the schools or districts, providing many additional points of failure. The likelihood of failure of such servers is much higher than the likelihood of failure of our industrial, fully redundant servers hosted in professional, secure hosting facilities. Hence, a caching server approach requires more technical expertise within schools or districts, requires more

Exhibit 7.4.8.3-5: Possible Interface Configurations

Name	Description	Examples
Look and Feel	• Skin • Color theme • Header and footer	• Combination of blue and green as the color theme • The Department icon as part of the header

Test Administration Windows	• Test administration windows (can be specified by test or a group of tests)	• Grade 3–8 Math
		  ○ 03/02/15 6:59 a.m. – 03/13/15 11:59 p.m.
		• Algebra 1 EOC
		  ○ Window 1: 04/07/15 6:59 a.m. – 04/25/15 11:59 p.m.
		  ○ Window 2: 07/13/15 6:59 a.m. – 07/24/15 11:59 p.m.

Test Settings	• Can the test setting be changed after the student has begun the test? • Which test settings should be visible? • What is the sort order of displaying these settings? • Are TAs authorized to change the test setting?	Some examples of test settings include the following: • Color Choices • Font Size • Font Type • Print on Request • Others
TA Refresh Rate for New Students	Indicates how often (in seconds) the TA interface will refresh for students who are awaiting approval.	30 seconds
TA Refresh Rate for All Else	Indicates how often the TA interface will refresh the current status of students testing in the session, using a variable that is multiplied with the value entered in "TA Refresh Rate for New Students."	2 times, resulting in a total proctor refresh rate of 60 seconds (2 x 30)
TA UI Timeout	Indicates how long (in minutes) a TA and students can be idle before the proctor is automatically logged out of the test session.	20 minutes
TA Check-in Time	Indicates how long (in minutes) a TA's test session can be idle before the system automatically closes the test session	20 minutes

maintenance, and increases the likelihood of failure. Our ability to deliver tests without extra hardware or expertise has contributed to our record of success wherever we implement online tests.

Multi-Fault Tolerant Design (with Immediate Continuation of Testing Activity)

From our online testing experience with multiple states, AIR understands that unforeseen test interruptions can occur. For example, there could be an unplanned fire drill, where a TA needs to immediately pause a test session; a power outage, where testing suddenly stops, or a student could suddenly get ill and the TA needs to pause his or her test.

AIR's priority in these circumstances is two-fold: (1) to protect the integrity of all test data impacted by the interruption, and (2) to minimize test interruption by enabling the TA and students to immediately continue from where they left the test. Thus, the third innovation that reduces burden on schools is a fault-tolerant design in *multiple* aspects of the system

and *immediate* availability of resuming testing operations. We have done this in four ways:

1. Designed our hardware and network to be extremely fault tolerant such that the system can withstand failure of any component with little or no interruption of service (see sections on automated backup and disaster recovery procedures).
2. Designed our software so it recovers from interruptions in Internet service without loss of data and often recovers without users even becoming aware that the service was interrupted.
3. Designed our TA interface to enable TAs to pause a student test at any time, or to pause the entire test session (effectively pausing all active tests in that session).
4. Built in real-time participation reports that inform the Department (and other authorized users) about the testing status of students and test session information. The reports provide information about current testing activity and are a powerful tool for monitoring progress toward getting students tested. See Section 7.5.5 for more details on reporting.

Disaster Prevention and Recovery

We have designed our system to be extremely fault tolerant. The system can withstand failure of any component with little or no interruption of service. One way that we achieve this robustness is through redundancy. Key redundant systems are as follows:

- Our hosting provider has redundant power generators that can continue to operate for up to 60 hours without refueling. With the multiple refueling contracts that are in place, they can operate indefinitely. They maintain an n+1 configuration of 16 diesel generators that, at maximum capacity, can supply up to 2.0 megawatts each.
- Our hosting provider has multiple redundancies in the flow of information to and from our data centers by partnering with nine different network providers. Each fiber carrier must enter the data center at separate physical points, protecting the data center from a complete service failure caused by an unlikely network cable cut.
- Every installation is served by multiple web servers, any one of which can take over for an individual test upon failure of another.
- Active/passive clusters of database servers are configured so that the passive node takes over in the event of failure of the active node.
- Each database server in a cluster has dual connections to the disk arrays containing the system data.
- Each disk array is internally redundant, with multiple disks containing each data element. Failure of any individual disk recovers immediately by accessing the redundant data on another disk.

Data are further protected by nightly backups. We complete a full weekly backup and incremental backups nightly. The systems are run with full transaction logging, enabling us to restore the system to its state immediately prior to a catastrophic event.

All backup media are stored in a secure, fireproof, off-site location. Our hosting provider ensures that all media sent offsite are shipped in locked, water-resistant and impact-resistant containers. Our off-site vendor does not have direct access to individual media containing customer data at any point or any time during transport. The offsite storage location is audited on a regular basis to ensure that proper physical security, media management, and location tracking are meeting the hosting providers' industry standard guidelines.

7.4.8.4 Security Requirements

AIR has built-in security controls in all of its data stores and transmissions. Unique user identification is a requirement for all systems and interfaces. All of AIR's systems conduct external data transfers on a Secure FTP connection, and login information generated during user addition is communicated securely to individual users. All communication with any of the online websites happens over SSL – this ensures passwords and secure student data are not passed over the network in clear text.

All of AIR's systems enforce unique identifiers for all users, including students. The TIDE database is set up to require an external ID for every user uploaded and edited in the system, and it will reject any record if it does not meet this requirement. Students log in with identifying information and session ID, and the Test Administrator authenticates the students and admits them to the session. Please see Section 7.4.8.3 for more information on test administration.

Security of student information is protected at all times, with security procedures acting at three levels:

- Physical security, preventing access to the machines on which data reside or are processed
- Network security, including protection of our networks from infiltration and secure transmission of data over our networks and others
- Software security, ensuring that only authorized users access information on our systems and that their access is limited only to information that they are authorized to view

Physical Security

Florida Department of Education data will reside on servers at Rackspace, our hosting provider. Rackspace maintains 24-hour surveillance of both the interior and exterior of its facilities. All access is keycard controlled, and sensitive areas require biometric scanning.

Access credentials are assigned only for authorized data center personnel, and only they have access to the data centers. Visitors' identities are verified, and visitors are escorted at all times while in the facility.

All data center employees undergo multiple background security checks before they are hired.

Secure data will be processed at AIR facilities and will be accessed from AIR machines. Similar security procedures are in place in our facilities. Access to our facilities is keycard controlled. Visitors must sign in and be escorted while in our center. Our servers are in a secure, climate-controlled location with access codes required for entry. Access to our servers is limited to our network engineers, all of whom, like all AIR employees, have undergone rigorous background checks.

Staff at both AIR and Rackspace receive formal training in security procedures to ensure that they know and implement the procedures properly.

AIR and Rackspace protect data from accidental loss through redundant storage, backup procedures, and secure off-site storage.

Network Security

Hardware firewalls protect our networks from intrusion. They are installed and configured to prevent access for services other than HTTPS for our secure sites. Our firewalls provide a first level of defense against intrusion, backed

up by a capable second line: hardware and software intrusion detection and remediation. Our intrusion detection systems constantly monitor network traffic and raise alerts for suspicious or unusual network traffic.

Our systems maintain security and access logs, which are regularly audited for login failures, which may indicate intrusion attempts. Suspicious log entries are investigated and resolved.

All secure data transmitted across the public Internet are encrypted using SSH (AES) or an IPSec VPN. Secure websites encrypt data using 128bit SSL public key encryption.

The hosting environment is protected by an AlertLogic Threat Manager Intrusion Prevention System (IPS) appliance at the perimeter and by Symantec Antivirus Corporate Edition on each individual server. The AlertLogic IPS appliance combines intrusion protection and vulnerability management technology into a single integrated solution that offers both proactive and reactive protection from the latest threats. Symantec Antivirus offers real-time virus and malware protection for our servers along with centralized management and administration capabilities.

Software Security

All of our secure websites and software systems enforce role-based security models that protect individual privacy and confidentiality in a manner consistent with Florida's privacy laws, FERPA, and other federal laws.

Our systems implement sophisticated, configurable privacy rules that can limit access to data to only appropriately authorized personnel. Different states interpret the Family Educational Rights and Privacy Act (FERPA) differently, and we support customized interpretations. Our system is designed to support these interpretations flexibly. AIR is committed to working with the Department to maintain data security according to its specifications.

Secure transmission and password-protected access are basic features of the current system and ensure authorized data access. All aspects of the system, including item development and review, test delivery, and reporting, are secured by password-protected logins.

Our systems use role-based security models that ensure that users access only the data to which they are entitled and that limit their ability to change that data according to their rights. User rights have two dimensions: the user's role and the user's data access rights. The role determines what actions a user can take, which types of reports he or she can view, and similar functional limitations. Data access rights tell, for example, which principal can view which teacher and student data. Data access rights are governed by relationships among entities in our Roster Tracking System (RTS), along with a configurable set of business rules. The business rules describe which access rights correspond to which relationships and enforce client-specific policies. We will work with the Department to maintain current business rules and adjust business rules as needed.

7.4.9 Computer-Based Test Administration Overview

Introduction

The American Institutes for Research (AIR) is pleased to propose a proven, online testing solution to assess student proficiency with the Department's State Standards. Our proposed solution offers

- a robust, online test delivery system that has proven effective, requiring little equipment, bandwidth, expertise, or support and including the ability to deliver tests on iOS and Android tablets and Chromebooks;
- a student experience that empowers students with the broadest range of access technology available in a statewide system, while also offering a simple, accessible interface free of distraction;
- the industry's richest repertoire of item types, using technology to probe deeper into students' understanding by asking them to construct responses graphically using language and simulations; and
- the industry's broadest set of available machine-scoring (sometimes called "artificial intelligence") engines.

AIR's test delivery system currently delivers statewide assessments in Delaware, Hawaii, Minnesota, Oregon, and the Ohio Assessment Pilot and delivered the Smarter Balanced Assessment Consortium pilot test in spring 2013. All of the features described here are currently operational.

Student Interface

Students take tests through the Student Interface, which is essentially a secure website accessed through AIR's secure browser. This browser is the only software needed to take a secure test, and it is simply a secure build of the Mozilla (Firefox) browser or a secure testing app for tablets and other platforms.

Non-secure tests, such as practice tests and some formative tests, can be accessed with ordinary browsers. AIR's secure browser operates in a full-screen mode, disables access to other applications, and prohibits navigation outside the test. The browser is designed to intercept all operating system hot-key combinations and print capabilities; it enables keyboard combinations specifically designed for test navigation. The system verifies that the test is being launched in AIR's secure browser and prevents the test-taker from continuing if the test is launched in a normal browser window.

The Student Interface is designed to be intuitive and make it easy for students to track information on a single screen. The interface incorporates many tools and accessibility features, and various layouts are available for items that require reading passages, graphics, or other item stimuli. While the layouts are completely configurable, we encourage states to select layouts that allow students to read left to right and top to bottom as they naturally would with a paper-and-pencil test.

Test Administrator Interface

Test administrators (TAs) use the TA Interface to create and manage test sessions. The interface allows authorized TAs to administer test sessions, monitor activity, and respond to test-related issues in one convenient location. At the time of testing, the test administrator starts a testing session with as few as two mouse clicks. The system assigns a session ID, and student login is simply a request to enter a session. Students log in with identifying information and the session ID. From his or her workstation, the TA authenticates the students and admits them to the session. In this way, the roster of students to be tested builds itself as students log in. This eliminates the need for the TA to roster students into sessions, thus reducing the school's workload. Please see section 7.4.8.3 for more information about the TA Interface.

In section 7.4.9.6, we discuss the tools and features available to students in the test delivery system, along with universal design concepts. In section 7.4.9.7, we present a quick tour of the interface with which students interact,

highlighting screen layouts for the presentation of computer-delivered test items.

7.4.9.1 Hardware and Software Requirements

In schools and districts, AIR's test delivery system has succeeded where other systems have failed. We designed our system to work within the confines of real-life schools. Schools often have limited bandwidth, older hardware, and limited or nonexistent technical support. Our system is a purely Internet-based system, and we support operating systems and browsers longer than their original manufacturers. This covers almost all the computers currently found in schools. Within the schools, the only software required is AIR's secure browser. It can be installed with the click of a button, and installation options are available that do not even require administrative privileges on the computer. The secure browser locks down the computer, preventing the student from navigating away from the test or starting other software. It also disables keystrokes that can threaten the security of the test. For example, it disables screenshots and navigation and prevents test-takers from viewing the source and opening the "taskbar." It continuously monitors other activity on the computer for possible threats and terminates testing if a threat is detected.

Our system is purely HTML-5- and Internet-based. To ensure the security of the test, we require the use of our secure browser for all operating systems except Chrome OS (for Chrome, we are able to secure the native Chrome browser).

7.4.9.2 Eligible Device Specifications

AIR currently provides support for all of the platforms and ancillary devices identified in Tables 7.4.9.2A and 7.4.9.2B of the ITN. In addition, our system supports older versions of the Windows, Mac, and Linux operating systems. In fact, AIR's online test delivery system can support nearly three times as many of the Department's current student computers as the required specifications allow. This well-proven capability offers the Department the option of moving more quickly online and gaining the benefits of faster turnaround and reporting.

AIR analyzed the results of the Florida Innovates Technology Resources Survey Statistical Report (2012) to produce Exhibit 7.4.9.2-1. According to the survey, there are approximately 1 million desktop and mobile (laptop or netbook) computers available to students in the state. Of those, AIR calculated that 337,566 meet the operating system requirements of the ITN. An additional 678,832 meet the operating system requirements of AIR's test delivery system.

AIR's test delivery system is currently supported across older platforms, allowing Florida to utilize more of its existing computers for testing. AIR's support for Windows VISTA, Windows XP, and Mac OS 10.5 and above would almost triple the Department's technology resources for testing.

Exhibit 7.4.9.2-1: Florida Technology Resources and AIR Support

	Number of Student Computers Meeting ITN Specifications	Number of Student Computers Meeting AIR Specifications	Additional Computers Available for Testing
Windows Desktops and Laptops	319,974	920,145	600,170
Mac Desktops and Laptops	17,592	96,254	78,662
TOTAL	337,566	1,016,398	678,832

7.4.9.3 System Performance Requirements

Our test delivery system does not require any local caching servers, proctor caching servers, or other specialized software requiring expert-

ise, support, or maintenance. Such devices increase the support load at the school, depend on vulnerable within-school servers, and historically have required support and periodic upgrades. Our system does, however, support local caching and does so without requiring extra servers or additional software. The memory of the browsers on the student machines are used to cache item content (this cache is never written to disk). This patent-pending approach has enabled us to deliver media-rich content where others have failed.

Our system relies on highly optimized, secure Internet delivery. Install the secure browser on the machines that the students will use, and the rest happens between the student workstations and AIR servers. A typical test requires only approximately 5–10 kilobits of bandwidth per second. This means that a typical school can easily test hundreds of students simultaneously. In fact, 5–10 students can be tested on the bandwidth typically available through a single smart phone.

Our approach means a smooth and robust testing experience for students. Results from 2013 show that the typical student waited less than half a second after having finished one item before the next item was fully displayed on his or her screen. The system recovers from interruptions in Internet service without loss of data and often recovers without users even becoming aware that the service was interrupted.

We prevent data loss by saving responses in real time to AIR servers. The safe, asynchronous writing system reports the successful save back to the browser. If the browser does not receive the response after a configurable amount of time (usually 30–90 seconds), the system stops the student from testing until connectivity is restored.

This same process protects data in case of power outage. Responses are submitted immediately upon student response or automatically and frequently during longer responses. If the power goes out, the student responses prior to the outage are already at AIR servers.

Contrast this with a system that relies on local caching of student responses. A failure of the local caching server could lose many responses from many students. Our efficient use of real-time Internet communication avoids such calamitous possibilities.

We know that students wait an average of less than half a second after they press the button before the next item is logged on the screen because we log this information. This information helps us to

- accurately report information about the student testing experience;
- plan capacity to make sure servers are never overworked; and
- identify schools that may be having local delivery problems.

The last point is particularly powerful. We have contacted schools to help troubleshoot before they were even aware that they were having a problem. Imagine a help desk that responds before the user even notices a problem. We believe that this level of information and transparency is unique within the industry, and we encourage reviewers to seek item–by–item latency (delay) data from other offerors who claim that their systems are responsive and scalable. In addition, our system records an audit trail that tracks every time a student changes an answer or revisits a question.

Our architecture sends results back to the server as the student is responding, so there is no need to cache responses and no risk that failed

machines in a school can lose student data. If a response cannot be saved due to a lack of connectivity, the student is stopped from testing. When responding to constructed response items, student responses can be saved frequently automatically, as well as on-demand when a student presses the Save button.

Our test delivery system also has an infinitely scalable architecture. AIR's system is based on a private-cloud design that allows every function to be distributed across many database and application servers, while maintaining responsiveness. In preparation for our Smarter Balanced field test, we plan a 500,000-simultaneous-user-load test in January 2014 (i.e., 500,000 students all testing at the same time). This load is sufficient to prove the scalability of the system—it will be deployed on distributed hardware for every function. Scaling up from the 500,000-simultaneous users will only require deploying more hardware on our private cloud. For the Department, we can either add to one of the two shared clouds that we are building (adding capacity to the expected load where necessary), or if the Department would prefer (and at a somewhat higher cost), on a private cloud solely deployed for Florida.

7.4.9.4 Connectivity Requirements

We understand that schools often do not have the best or fastest equipment or networks, and they often have limited technical support available. AIR's test delivery system has the smallest possible technology footprint in the industry and low end-user maintenance. We accomplish this with an architecture that

- is a fully web-based, adaptive test system;
- requires no external caching servers to manage;
- requires no extra third-party software;
- supports a wide range of OS and HW; and
- works on wired and wireless networks.

7.4.9.5 Test Site Set-Up/Certification Requirements

As mentioned in sections 7.4.9 and 7.4.9.1, we require the use of our secure browser to ensure security of our tests.

We have a web-based tool that performs a "system check" to assess the readiness of a particular computer for testing. One of the checks is a download and upload speed check that includes an estimate of the number of simultaneous examinees who can test at the same location. This tool has proved useful to other K–12 programs, and AIR will make this system check tool available to the Department.

The diagnostic readiness tool uses a sophisticated statistical model of the testing process that models variation in instantaneous demand (e.g., the number of students who simultaneously press the Next button) and evaluates the likelihood that peaks will exceed network free capacity (not used by other processes) with a frequency likely to cause noticeable delays in testing. Exhibit 7.4.9.5-1 presents the user interface for our integrated diagnostic tool.

7.4.9.6 Computer-Based Test Presentation Requirements

Our test delivery system offers the industry's most robust set of operational features. In this section, we describe the tools and features available and summarize the accessibility features available.

Tools and Features

AIR's system offers a broad array of tools, including calculators, formula sheets and other resources, notepads, measurement, and tools. Exhibit 7.4.9.6-1 shows our straight edge,

Exhibit 7.4.9.5-1: Simple, Effortless, Accurate Diagnostic Tool

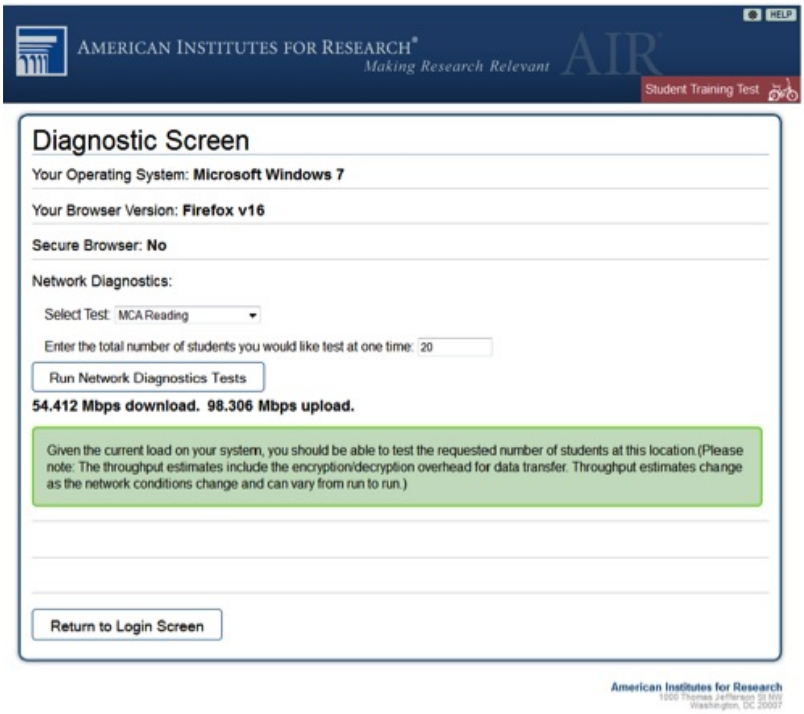

Exhibit 7.4.9.6-1: Test Delivery System Measurement Tools

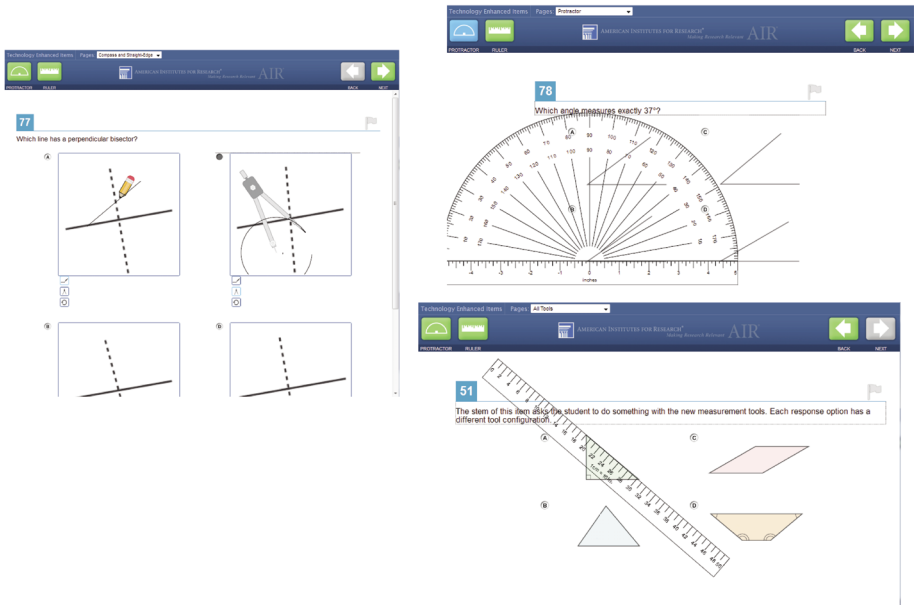

ruler, compass, and protractor. As with the rest of our system, these tools are entirely built in HTML-5 and can be completely controlled by the keyboard. We believe these HTML-5- and keyboard-controlled tools are unique within the industry. Exhibit 7.4.9.6-2 offers a more complete listing of our available tools.

Some tools make sense configured by item, such as the measurement tools in Exhibit 7.4.9.6-1. Other tools, such as calculators, need to be in separate "segments." Our segmentation capability allows students to complete items in one segment, review them, and indicate completion before moving on to the next segment. Once a segment is completed, the student cannot return to it; this capability would prevent the student from, for example, accessing a calculator when its use is prohibited.

Accommodations and Embedded Supports

AIR has a long standing commitment to students with disabilities and to students who are English language learners (ELLs). We have been committed to accessibility for all students ever since we conceptualized and designed our test delivery system and its items. We continue to make accessibility a top priority as we build more innovations around student testing and learning.

AIR's test delivery system offers a robust array of accessibility features, as illustrated in Exhibit 7.4.9.6-3.

AIR is proud not only that we offer these features but that virtually all are in operational use right now in states for which we are providing online testing.

In this section, we would like to highlight a few accessibility features that we have deployed recently. In 2013, AIR introduced individual-

Exhibit 7.4.9.6-2: Summary of Available Tools

Tools	Description	AIR System Capability and Comments
Required Features		
Calculator	Available calculators include basic, scientific, graphing, regression, and matrices.	Currently Available
Reference Sheet	Students can access a formula sheet and periodic table for Mathematics tests.	Currently Available
Ruler	Students can access a pop-up ruler.	Currently Available
Preferred Features		
Straight Edge	Students can access a pop-up straight edge.	Currently Available
Option Eliminator	Students can eliminate any multiple-choice option, whether it's in text or graphic. This capability persists throughout the test.	Currently Available
Bookmark	Bookmark capability allows students to flag an item so they can review it.	Currently Available
Highlighter	Students can select any text to highlight. This capability persists throughout the test.	Currently Available
Notes	Item notes allow students to jot down ideas about items or passages.	Currently Available
Footnote Pop-up	Our word list feature supports footnote pop-ups.	Currently Available
Student Tutorials/ Practice Sessions	A reference feature, practice tests, and tutorials familiarize students with the online testing system. Our tutorials can vary by item, so items of each type share a tutorial.	Currently Available

ized item pools that take each student's access restrictions and produce a custom filter on the pool in real time when items are being selected. This feature is most relevant to adaptive tests and helps demonstrate the depth of our commitment and capability to serving all of Florida's students.

We note that we support American Sign Language (ASL) through recorded video rather than avatars. Working with representatives of the deaf community, we learned that ASL is not simply a representation of English. Rather, it is a unique language. Avatars are not capable of translating from English to ASL and instead provide a word-for-word translation. To speakers of ASL this seems as unnatural as a word-for-word translation from English to any other language. Furthermore, ASL is more syntactically dense than the major gestures. Cues such as facial expression and lip movement form part of the language. Avatars neglect this aspect of the communication. Therefore, we present ASL through video. This is shown in Exhibit7.4.9.6-4.

We have recently developed a feature that we call "word lists." Word lists support a wide variety of accommodations and embedded supports through a common, simple interface. Some students require a contextualized dictionary, glossary, or second-language dictionary or translation. Word lists support all of these features. Any word in any item text can be associated with word lists of each type. Individual student profiles determine which types of word lists are active on each student's tests.

The interface is simple, intuitive, and not distracting. Students mouse over words or move to them using the keyboard, and words associated with entries in the word list are highlighted. This "mouse over" approach avoids the distraction of many highlighted words (which research has shown decreases comprehension). Once a word is highlighted, clicking or selecting with the keyboard brings up the word

Exhibit 7.4.9.6-3: Accommodations and Accessibility Supports

Accessibility Feature	Description	AIR System Capability and Comments
Accommodation Features (Required)		
Variable Font Size	Available calculators include basic, scientific, graphing, regression, and matrices.	Currently Available
Administrator-Selectable Zoom	Default font size can be set in advance through a file upload or user interface or at the time of testing by the test administrator. Student can zoom or unzoom at any time.	Currently Available
Administrator-Selectable Large Print font	Default font size can be set in advance through a file upload or user interface or at the time of testing by the test administrator. Student can zoom or unzoom at any time.	Currently Available
Administrator-Selectable Variable Font and Background Colors	Any foreground and background color can be supported.	Currently Available
Administrator-Selectable Screen-Reader	The system supports an integrated screen-reader that can be configured to provide a variety of support levels, each selectable by the administrator.	Currently Available
Administrator-Selectable Assistive Devices Integration	Our system has a standard and a streamlined interface. Most assistive devices can work with the former, and an even wider group works with the latter. If the use of the device requires relaxation of certain security features (e.g., if suppression of pop-up windows interferes with on-screen keyboards), the administrator can select our more "permissive mode" if the Department chooses to offer this feature.	Currently Available
Additional Accommodations and Embedded Supports		
Additional Time	AIR's system currently does not impose a time limit on the test. It is up to the proctor to stop a student's test or stop the entire session. However, if there are unforeseen events, such as a fire alarm, that trigger additional testing time, AIR's system can enable a grace period extension for a single test opportunity or for multiple test opportunities.	Currently Available
Segment Breaks	AIR's system has the capability of adding test segments within a test. A test segment is made up of multiple item groups and creates a logical break between segments within a test. For example, a segment break might separate a calculator from a non-calculator segment of a test.	Currently Available
Text-to-Speech—Directions, Passages, Items	Computer reads text and graphics aloud on directions, passages, and items. What is read and how it is read is configurable, and the Department can offer a variety of options.	Currently Available
Text-to-Speech —Graphic Description	Computer reads graphics and tables aloud.	Currently Available
Color Overlay	Any color can be laid on the screen. This persists throughout the Test.	Currently Available
Recorded Audio	Computer efficiently delivers recorded audio. We are able to deliver voice-audio using only about 10Kbps of bandwidth.	Currently Available
Reverse Contrast	Background turns to black, while text turns to white.	Currently Available
Line Reader	This feature will allow a student to track the line he or she is reading.	Currently Available

Exhibit 7.4.9.6-3: Accommodations and Accessibility Supports (Continued)

Accessibility Feature	Description	AIR System Capability and Comments
Refreshable Braille/ Tactile with External Embosser Printer	Items can be rendered to desktop embossers that can integrate Braille and tactile graphics. The items will simultaneously render on a reader-accessible screen, and the student will be able to navigate to response spaces to provide answers.	Currently Available
Magnification	Student can zoom and unzoom the entire page. This capability persists throughout the test. In addition, in the near future, this capability will allow the student to selectively magnify areas on the screen.	Currently Available
Masking	Students can mask extraneous information on the screen.	Scheduled for Deployment Winter 2013.
Speech-to-Text	Speech will be converted to text and then saved in the database.	Available Through Compatibility with Third-Party Assistive Technology
Sign Language—Directions, Passages, Items	This capability consists of recorded videos on sign language. Avatars are not recommended by hearing-impaired experts since they do not translate well to American Sign Language.	Currently Available
Translations	Versions are available in alternate languages.	Currently Available
Glossaries and Dictionaries	These enable content developers to associate additional content with words or phrases. The content can be of multiple types, and the content shown to a student can be controlled by his or her personal profile.	Currently Available
Alternate Language Glossaries and Dictionaries	These enable content developers to associate alternate-language content with words or phrases. The content can comprise multiple types, and the content shown to a student can be controlled by his or her personal profile.	Currently Available
Secure Print Facility	A visual accessibility feature, the secure print facility allows the secure printing of items or passages. A student requests that a passage or item be printed; the request is then encrypted and sent securely to the proctor; the proctor needs to approve the request before it is sent to the printer. In addition, this feature also allows for the delivery of real-time paper tests, including large print tests.	Currently Available
Test Pauses and Restarts	An attention accessibility feature, test pauses and restarts, allows the test to be paused at any time and restarted and taken over many days. So that security is not compromised, visibility on past items is not allowed when the test has been paused longer than a specified period of time.	Currently Available
Writing Checklists	An attention accessibility feature generally for essay items, the writing checklist enables a student to check off writing guidelines from a checklist.	Currently Available
Review Test	Students can review the test before ending it.	Currently Available
Area Boundaries	An agility accessibility feature, area boundaries for mouse-clicking multiple-choice options allow students to click anywhere on the selected response text or button.	Currently Available
Language	Any language that is necessary can be supported.	Currently Available
Help Section	A reference feature, the Help Section explains how the system and its tools work.	Currently Available
Performance Report	A reference feature, a performance report is available at the end of the test for the student.	Currently Available

Exhibit 7.4.9.6-4: American Sign Language

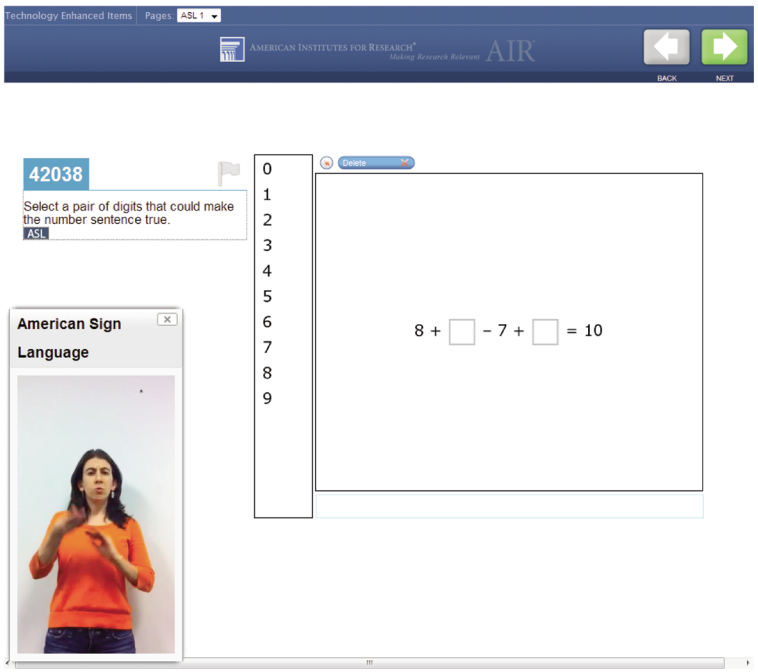

Exhibit 7.4.9.6-5: Word Lists

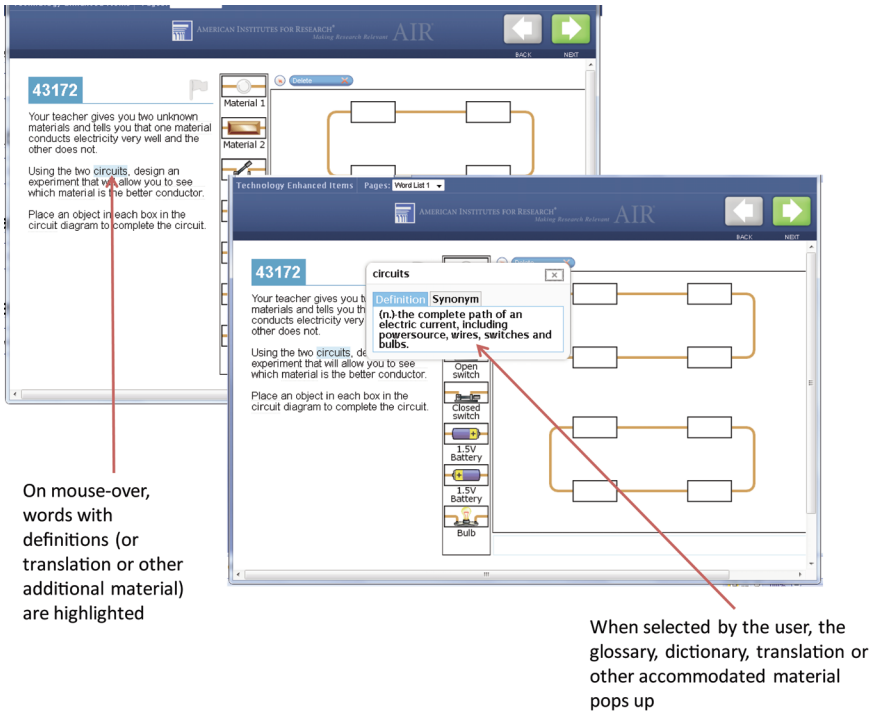


On mouse-over, words with definitions (or translation or other additional material) are highlighted

When selected by the user, the glossary, dictionary, translation or other accommodated material pops up

list entries indicated by the student profile. This is illustrated in Exhibit 7.4.9.6-5.

Assignment of Tools and Supports

Each accommodation can be one of three different configurations or combinations of these choices: (a) available to all students, (b) assigned to students in advance by the designated state, district, or school administrators or through data upload, or (c) assigned to students at testing time by the proctor.

Delivery Choices

We propose to offer a broad array of features. Furthermore, as we continue to innovate to extend the accessibility of the test, improve measurement, and make testing more engaging, features will proliferate. This presents a bit of a conundrum: How will students know what features are available? Students only test once or a few times a year. Therefore, they will generally not become "expert" users of the software. Making the appropriate tools available is best accomplished by offering each student the set of tools he or she needs, without the distraction created by tools that are not needed.

Each tool or embedded support provided by AIR's system, by design, may be configured to be

- available to all students;
- made available to students by one or more adult roles in the system (e.g., state, district or school test coordinator, test administrator); and

- offered to all students but configured for each student by adult users.

Exhibit 7.4.9.6-6 illustrates some of the configurations other clients have chosen for some of the offered accommodations.

Some of the accessibility features require special attention and preparation to make them effective and meaningful for the item and the student taking the test. These features were designed to serve their primary purpose in as meaningful a way as possible by pulling in the appropriate resources. In addition, each feature is effective only if it interacts seamlessly with the items it is presented with as well as other features. Exhibit 7.4.9.6-7 lists these features and their respective requirements for preparation.

7.4.9.7 Computer-Based Test Screen Layout Requirements

The "look and feel" of AIR's TA and Student Interfaces is customizable. Each test (grade, subject, etc.) can have its own default font and layouts, among other options. There is a broad array of available tools and accessibility features for students that can be configured in different ways. Additionally, AIR offers a wide range of tools in the TA Interface for monitoring testing activity and system health.

First, we present a quick tour of the interface with which students interact. This selection is not intended to be exhaustive. For example, the screenshots that follow show very few of the item types supported and only a handful of the embedded supports that we offer, many of which are currently operational in our partner states.

Student Interface Layout

Our student interface begins with a simple look and feel. The "look and feel" is customizable. Each test (grade, subject, etc.) can have its own default font, layouts, etc. Exhibit 7.4.9.7-1 shows a sample AIR TabletFirst skin. This skin began with a design for tablets and brought the same look and feel to other devices. Notice that the interface is not cluttered with tools or options. In general, we simplify the interface in two ways:

- We move the selection of accessibility tools or accommodations to precede the test. We usually recommend that the selections be made at registration time or by the test administrator at testing time, but the system can allow the student to make the selections. Some tools are configured to be available to all students taking a particular test.
- We use context menus for students to access the various tools and supports. This serves two purposes. First, it is part of our strategy to make sure the entire system is keyboard navigable, using a very small number of keyboard commands. This strategy is necessary to support alternate input devices, such as switch arrays, that provide access for some students. Second, it supports all students by making all the relevant tools and options available in the context in which they are relevant. This helps students find what they need when they need it. Remember—students test rarely and hence cannot be expected to become "expert users" of the software.

Exhibit 7.4.9.7-2 illustrates our context-menu strategy. One click (or keystroke) brings up the menu. The menu presents all the relevant options within the context. In this case, the menu includes highlighting, mark-for-review, view the tutorial, text-to-speech for the question, or text-to-speech (TTS) for the selection (which the student had previously selected, as indicated by the gray background around a snippet of text).

The system includes a host of small, intuitive features that help students navigate and use

Exhibit 7.4.9.6-6: Access Configurations for a Sample of Embedded Supports and Accommodations

Accessibility Feature	Example of Configuration Choice	State's Rationale Behind Configuration Choice
Color Choice	Assigned to students at testing time by the proctor	Most of our clients recognize that the proctor is the best person to determine the appropriate color since the student is with him or her in the room. If this tool is made available to all students, it would provide a distraction.
Increased Font Size	Default font size (assigned to students in advance)	A student's need for this feature is part of his or her school record and therefore can be determined in advance.
Text-to-Speech—Directions, Passages, Items	Assigned to students in advance OR Assigned to students at testing time by the proctor	In some states, a student's need for this feature is part of his or her school record and therefore can be determined in advance. In other states, it is available to all students but requires a proctor to turn it on to ensure that the student has a headset and so will not disturb anyone else.
Magnification	Available to all students	This feature does not provide a distraction, and the student may need it on different screens.
Answer Eliminator	Available to all students	This feature does not provide a distraction, and the student may need it on different screens.
Refreshable Braille	Assigned to students in advance	A student's need for this feature is part of his or school record and therefore can be determined in advance.

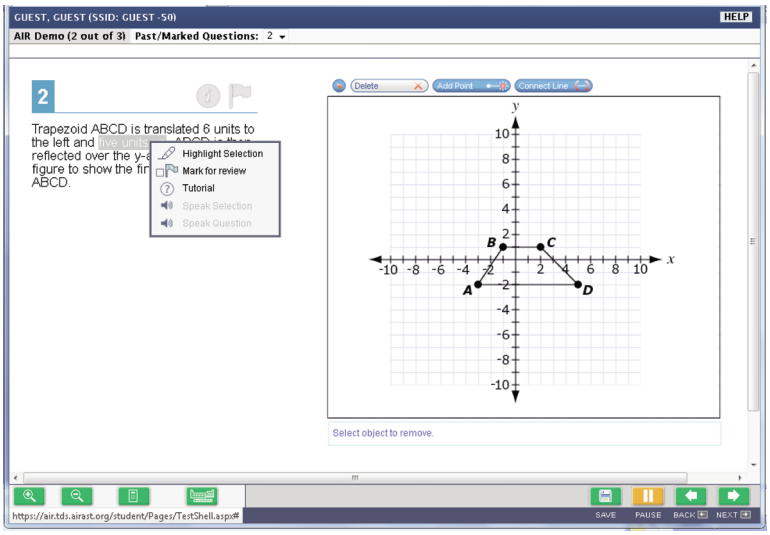
Exhibit 7.4.9.6-7: Accessibility Features and Preparation*

Accessibility Feature	Preparation
Color Choice	Colors that will be available on the system require that they do not conflict with the item graphics and text. For example, if a blue background is one of the background colors, the same blue cannot be used on item graphics. Thus, items need to be reviewed and may need tweaks if color conflicts arise.
Text-to-Braille and Text-to-Speech	Though the computer can automatically speak text rendered on the screen, special tags need to be created on graphics, directions, passages, and items. These tags would need to comply with the read-aloud principles determined by the Department.
Large Print and Magnification	Graphics need to be legible in large print and all available magnification levels. Ideally, graphics would be vector-based so they magnify in a clear and consistent way. However, if vector-based graphics are not possible, some graphics may need to be enhanced depending on their legibility at specific zoom levels.
Sign Language	Recorded sign language translations need to be created in advance and undergo review levels (ASL or Exact English).
Audio Files	Audio files need to be created or recorded in advance.
Language	Content needs to be properly translated in supported languages other than English.

*We note that the availability of system features does not imply content annotated or prepared for delivery using the feature.

Exhibit 7.4.9.7-1: Simple, Clean Interface (TabletFirst Skin)

Exhibit 7.4.9.7-2: Context Menus Ensure Keyboard Accessibility and Find-as-Available Functionality



the test without getting distracted. For example, the expand-passage function allows the student to allocate more room to the passage as he or she reads, while still having immediate access to the test items. While our system is capable of displaying one item in a set at a time, good testing practice presents students with the information for which they will be reading the passage before (or along with) the passage itself. The ability to expand the passage reduces the load on working memory and reduces the need to scroll or page. Exhibit 7.4.9.7-3 shows an example of this capability.

Our pure HTML-5 Student Interface supports the industry's widest set of devices, ranging from desktops and laptops to tablets and Chromebooks. Using standard HTML-5, we are able to deliver sophisticated animations, simulations, multimedia, and a wide range of input types. Exhibit 7.4.9.7-4 shows an online performance task that includes an HTML-5 animation and that asks the examinee to write equations using our HTML-5 equation editor. We note that the student responses can be machine-scored using symbolic math logic to evaluate whether any expression the student writes is mathematically equivalent to the correct answer. The equation-scoring engine can also evaluate whether the response has the correct functional form even though it might not be correct and whether there are other properties for which partial credit might be awarded.

7.4.9.8 Training Delivery Requirements

Providing comprehensive, ongoing training throughout the year on the new online testing system for Florida educators and administrators is essential to success. Below we propose an annual training plan that includes a series of interactive presentations on each of our online systems to be delivered through a combination of face-to-face training, webinars, and webcasts, and self-guided and self-paced online interactive sessions. These training sessions will support ongoing training for the following audiences:

Exhibit 7.4.9.7-3: Expand-Passage Function

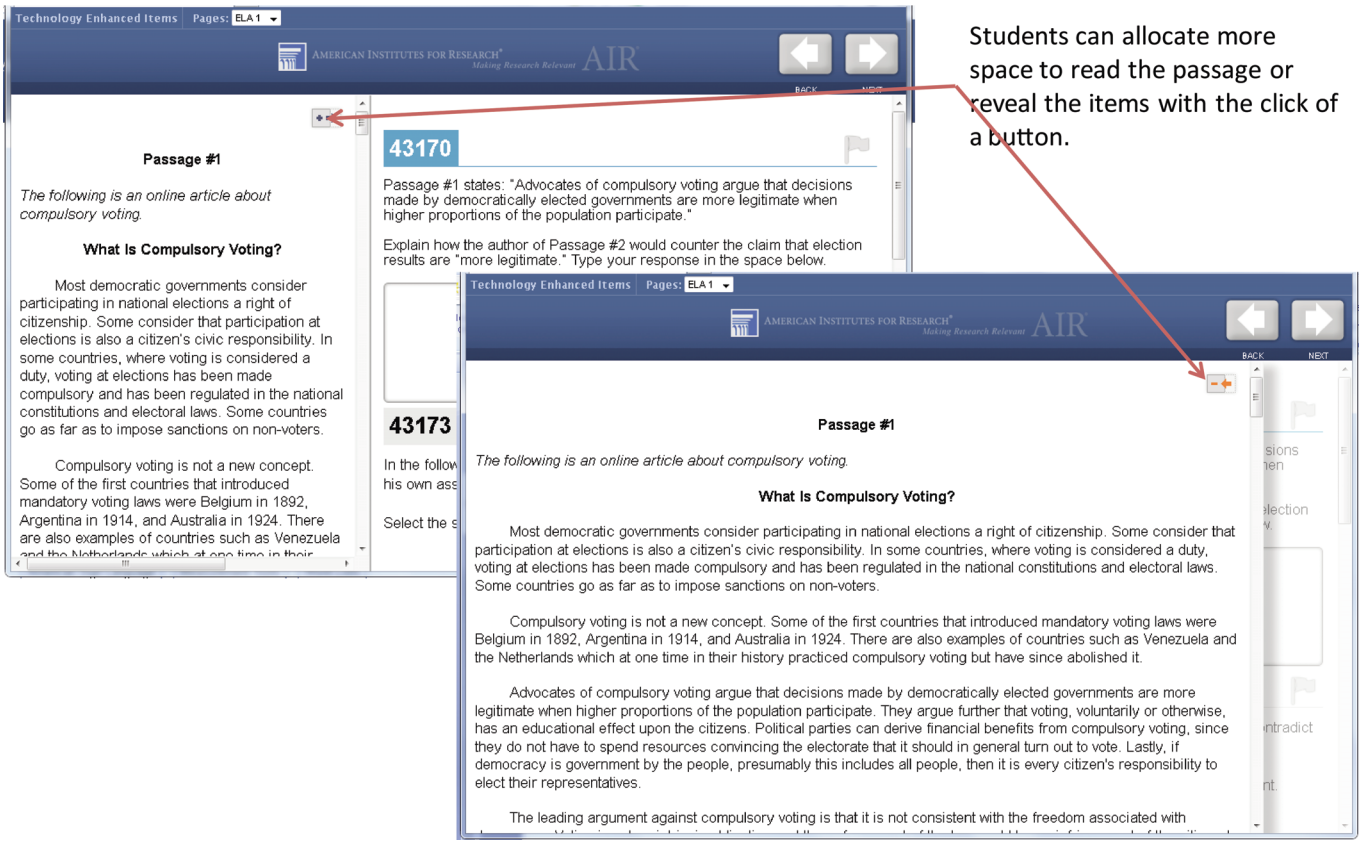


Exhibit 7.4.9.7-4: Integration with HTML-5 Animations and Simulations and Machine-Scored Equation

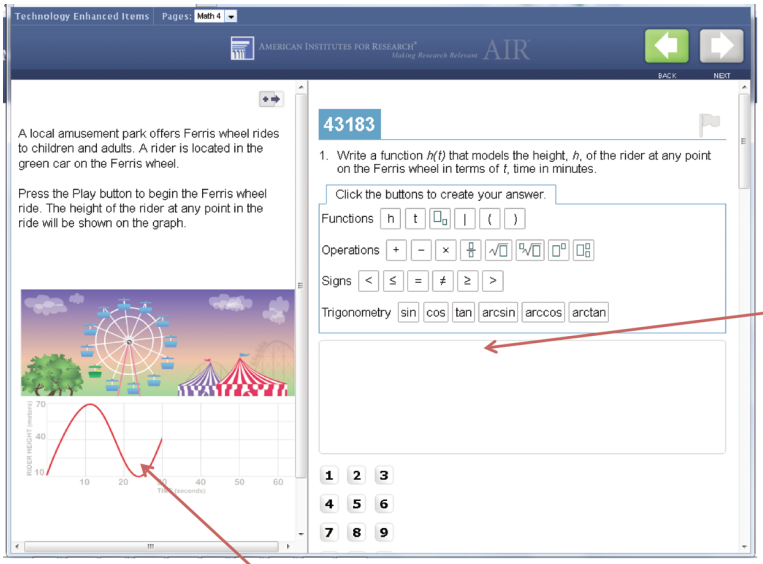


- Department K–12 Student Assessment program team
- Other Department staff
- District assessment coordinators
- School assessment coordinators
- School and district hardware/network technical staff
- School and district test administrators

Our experience transitioning large-scale assessment programs in Hawaii, Delaware, and Minnesota has taught us that clear, early communication about the new online testing system is an important training component. While training teaches stakeholders the hands-on skills needed to use each component of the new online testing system, communication lays the foundation for what to expect: How does the new online testing system differ from the old testing system? What kinds of training will be provided and when? Will my student have more than one opportunity to take the test, and if so, how will his or her final score be determined? Addressing these questions early on, in addition to having a comprehensive training plan, has proved effective in calming concerns and building critical stakeholder support.

In the next section we discuss our proposed plans for early communication and for ongoing, interactive training in more detail.

Proposed Plan for Early Communication

Transitioning a large-scale assessment program to online testing typically produces an enormous amount of information. The objective of an early communication strategy is to provide stakeholders with a clear structure for organizing and absorbing the information they will be receiving. We propose to accomplish this by collaborating with the Department to customize a communication tool for Florida parents, educators, and administrators. We also propose to work with the Department to develop a customized information portal for all Florida educators, administrators, families, and students that functions as a central repository for all communication and training materials.

The structure of the portal may be organized according to role (e.g., school assessment coordinator, teacher, technology coordinator, parent, student) or by separate, subject-specific tabs, such as Secure Browser, Training, General Resources/Manuals, FAQs, and Contact Us. The portal tabs function like a table of contents, helping users organize and locate information as needed. The portal home page also offers an easy-to-access location for important announcements and updates. Aside from functioning as a central information repository, the portal also provides each user role with password-protected access to only those components of the online testing system that are relevant to each specific role. AIR staff will work with the Department to configure the portal in the most optimal way for Florida educators and administrators.

Proposed Training Plan

In this section we propose an annual training plan that includes a series of interactive presentations on each of our online systems, which will be delivered through a combination of face-to-face trainings, webinars and webcasts, and self-guided, self-paced online interactive sessions.

AIR recognizes the importance of providing training for Department and district personnel to prepare them for online testing. We propose to conduct 10 half-day face-to-face onsite training workshops annually. Up to 500 Florida educators will participate in each onsite face-to-face training, attending a comprehensive half-day session with breakout groups address-

ing different topics in an interactive manner. We will work with the Department to identify training locations throughout Florida on up to 10 dates chosen by the Department in spring 2015.

AIR proposes to conduct a series of three moderated webinar presentations to accommodate those who could not attend the face-to-face trainings. We propose each of these three webinar sessions to be 30 minutes in length, plus include a question-and-answer period, and Department and district personnel will have the capability to call in to webinar sessions. We will post the webinar sessions on the information portal as webcasts. The webcasts will provide information about AIR's help desk, which will be available to answer all questions about any aspect of our online testing system. Successful district and school staff training, as well as thorough system documentation and support available on the information portal, has proved effective in minimizing questions about AIR's online testing system. For those who may need to ask questions that were not asked during webinar sessions, our help desk will provide additional support.

AIR's online interactive sessions are designed to teach both sophisticated technology users as well as users new to the system their roles and responsibilities in context of the new online systems. While sophisticated users may not need instruction on all steps of a specific function and can progress to the point in the tutorial they find useful, new system users typically find it useful to have instruction at a very detailed level. The online interactive sessions will also provide follow-up training throughout the year to educators and administrators who require it. In addition, the online interactive sessions can be developed to include quiz questions to provide the users with a gauge of his or her knowledge after the training. Each online interactive session will be up to 15 minutes in length.

Description of Proposed Training Topics

We propose to conduct comprehensive trainings on the topics displayed in Exhibit 7.4.9.8-1.

The following list provides more detailed descriptions of the proposed training topics.

1. **User Roles Chart.** This reference document indicates, at a glance, the access each user role is permitted in each online system. (Please see the sample user role chart in Appendix D.) System access for each user role will be reviewed in each webinar as appropriate. The user role chart will be posted on the portal, be available in manuals, and form part of the online, self-guided tutorials as determined in collaboration with the Department.
2. **How to Use TIDE.** This training includes instructions on how to add users at the district and school level so they can access appropriate online systems. The training also covers other TIDE functionality, including updating student test settings and setting test restrictions.
3. **Preparing Your Schools' Computer Lab.** This training includes information for school and district network administrators and provides guidelines for varied technical setup and technical support available at the schools. Technical setups include multiple secure browser installation methods, such as manual installation on individual machines, installation on machines through a network, access from a shared network

Exhibit 7.4.9.8-1: Proposed Presentations and Formats for Annual Training

Presentation Title and Primary Audience	Proposed Training Topics	Proposed Training Formats
Training Phase I: Preparing for Online Testing		
User Roles: Principals, Teachers, School and District Test Administrators, School and District Technology Coordinators, School and District Assessment Coordinators	User roles: Who does what and in which system?	1. User role chart 2. Will be a component of each webinar and face-to-face training
How to Use TIDE—Registering Users and Modifying Student Test Settings: School and District Technology Coordinators, School and District Assessment Coordinators	Teach schools and districts how to register users in TIDE, update student test settings, and set restrictions.	1. Webinar 2. Face-to-face training 3. Online interactive session
Preparing Your School's Computer Labs: School and District Technology Coordinators, School and District Hardware/Network Technical Staff	Steps for secure browser installation and minimum hardware requirements.	1. Instructions on portal 2. Face-to-face training
Training Phase II: Administering Online Tests		
Online Test Administrator Certification Course: School and District Test Administrators, Teachers	Learn how to use the new online testing system, set up a test session, manage and monitor testing, and assist students with online tools. Certification earned only by passing a mandatory quiz.	1. Online Test Administrator Certification Course
Online Practice Tests: Educators, School and District Test Administrators, School and District Technology Coordinators	Practice setting up, pausing, resuming, and ending live test sessions; setting accommodations; using the same functionality as the operational test administrator site.	1. Online practice tests 2. Face-to-face training
Online Practice Tests: Educators, School and District Test Administrators, School and District Technology Coordinators	Practice signing in to a live test session using the same functionality as the operational student testing site, including using text-to-speech, zoom, highlighter, and strikethrough and answering all item types	1. Online practice tests 2. Face-to-face training
How to Start and Monitor Online Testing and Modify Test Settings: School and District Test Administrators, Teachers	Learn how to set up a test session, modify test settings and monitor participation in multi-opportunity testing (in addition, learn how to reset and invalidate tests)	1. Webinar 2. Face-to-face training 3. Online interactive session
Training Phase III: Post Testing		
How to Use the Online Reporting System: Teachers, Principals, School and District Assessment Coordinators	Learn how to access student scores, create class rosters, and drill down from district and school results.	1. Webinar 2. Face-to-face training 3. Online interactive session

drive, and thin-client setup. Minimum hardware requirements will also be reviewed in detail.

4. **Online Test Administrator Certification Course.** This self-paced course includes detailed instruction on creating and managing test sessions, monitoring student activity, setting accommodations, and implementing test security measures. The course is designed to familiarize test administrators with the Student Interface, the approval process, and the tools students will use during testing. To ensure that course-takers have learned the skills necessary to proctor tests using the new online system, each user must pass a quiz at the end of the course before being permitted to sign in to the online testing system. Users who need to refresh their memory of course content can retake the course as many times as needed.
5. **Online Practice Tests.** Online practice tests for all assessments will be available prior to the opening of the test window. Each practice test will be composed of approximately 20 items that are a subset of the blueprint for the operational test, thus providing users with exposure to all item types. The online practice test site uses the same applications as the operational test site, such as the TA Interface, the Student Interface, and the test management reports. This design ensures that students, educators, and teachers become familiar with the online testing system before operational testing begins. In addition, user guides and systems documentation will be made available when the online practice tests open to help educators prepare their materials prior to testing. The online practice tests will be available throughout the test window.
6. **How to Start and Monitor Testing and Modify Test Settings.** This training includes information for test administrators on how to set up a test session, modify test settings, and monitor participation in multi-opportunity testing. In addition, test administrators will learn how reset and invalidate tests. The content for this training is the same as the Online Test Administrator Certification Course but is presented in a webinar and face-to-face presentation format.
7. **How to Use the Online Reporting System.** This training teaches authorized users how to use two types of reports: test management reports and performance reports. Users are shown how to use test management reports to monitor student testing status for their schools or districts and to identify students who have and have not tested. Users also learn how to use these reports to help schedule test activities for their school. Turning to performance reports, users learn how to view district, institution, personnel, roster, and individual student reports in table and graph format; access and use longitudinal reports for their diagnostic needs; filter score reports by student subgroup (e.g., gender, ethnicity, ELL); and manage online rosters (groups).

Each year, AIR will collaborate closely with the Department to update the face-to-face training presentations, webinars, webcasts, and online interactive sessions as needed. In the first year, we propose to focus all presentations on the basics of the program and the features of the online system. In subsequent years, we propose to focus training on the updates to each system and to provide basic refresher training on each system. Before the beginning of each school year, AIR will provide a training

Exhibit 7.4.9.8-2: Proposed Timeline for Year 1 Training

Training Type/Title	Proposed Timeline
1. Conduct Onsite, Face-to-Face Training	4–6 weeks before testing window opens
2. Webinar on TIDE	6–8 weeks before testing window opens
3. Webinar on How to Start and Monitor Online Testing and Modify Test Settings	6–8 weeks before testing window opens
4. Online Test Administrator Certification Course	4–6 weeks before testing window opens
5. Online Practice Tests Available	4–6 weeks before testing window opens
6. Webinar on Online Reporting System	6–8 weeks before testing window opens
7. System-Specific Online Interactive Sessions Available for Online Testing System, TIDE, and Online Reporting System	6–8 weeks before testing window opens

plan and schedule for the upcoming year. AIR will work with Department personnel to identify dates for the trainings that align with the testing schedule. A proposed timeline for Year 1 training can be found in Exhibit 7.4.9.8-2. AIR will work with the Department to develop and finalize a training plan for each upcoming year.

7.4.9.9 Technology-Supported Item Types

AIR's test delivery system is able to deliver a wide variety of item types. Based on a survey of existing systems and reviews and reviews of existing statewide tests, we believe that we offer the largest array of item types, and machine-scored, constructed-response item types in particular, in the industry. In this section we present a gallery of item types to illustrate these capabilities.

Rich Repertoire of Item Types

AIR's robust and flexible technology puts the ability to create a wide variety of item types in the hands of item developers. While it is typical to discuss items in terms of "item types," our success has derived from a broader, more generalized understanding. Instead of thinking about item types, our systems are built around a broad and growing collection of "response mechanisms." In addition to multiple-choice items, our system currently supports the following response mechanisms:

- Graphic Response, which includes any item to which students respond by drawing, moving, arranging, or selecting graphic regions
- Hot Text, in which students select or rearrange sentences or phrases within a passage
- Equation Response, in which students respond by entering an equation
- Word Builder, in which students respond by entering a single number or word
- Proposition Response, in which students respond in one or more English language sentences, which may be scored by our proposition-scoring engine or human scored, or a mixture of both
- Essay Response, in which the student response is a longer written response to be scored using an essay-scoring engine or a mix of machine and human scoring
- Simulator Interactions, in which students interact with a simulator and their sequence of choices and interactions can be scored according to an explicit rubric
- Spoken Response, which captures student speech for human scoring
- Scratch-Pad Response, which enables students to integrate text, free-hand drawing and equations to respond to items. These items will be hand scored.

AIR supports the standard QTI templates; however, most of the QTI technology-enhanced item types are essentially selected-response items. We strongly encourage our clients to avoid using technology to simply present selected-response items in a different format: the interactions are inherently less accessible than simpler formats, and universal design principles discourage such choices.

Our technology offers our client the chance to use technology to measure deeper knowledge and application of knowledge in a more open-ended way and to machine score many such items. We call these applications of the technology "machine-scored constructed-response," or MSCR. Most MSCR items remain accessible. Whenever accessibility is sacrificed for some population, we encourage our clients to weigh the measurement benefit. For example, recognizing cells under a microscope is an inherently visual task. Our simulation items can measure this ability, but the task itself cannot be made accessible to students who are blind. In this case, the skill itself limits accessibility, not the construction of the item. This is very different than presenting a selected-response item as a spatial matching or drag-and-drop task.

Our graphic-response mechanism supports most of the typical technology-enhanced item types, including sorting, matching, hot-spot, and drag-and-drop. In addition, it supports items where students actually draw a machine-scorable response and respond by constructing complex, open-ended diagrams, as well as many other possibilities. Because they are uniformly derived from a single response mechanism, the manipulations and interactions are consistent across these technology-enhanced item types, eliminating one possible source of construct-irrelevant variance.

Hot-text items are effectively selected-response items, though in some cases the number of potential selections is quite large. These machine-scored items can have multiple correct answers and allow for very flexible student responses.

The equation response mechanism asks students to enter one or more equations using a palette of symbols. Test developers can specify which symbols are available on an item-by-item basis, or the Department can choose to have the palette remain consistent across all of the items within a grade level.

The proposition response mechanism and essay response mechanism are very similar to short constructed-response and extended constructed-response items in which the students type their answers into the space provided. The response mechanisms differ by the length of response accepted (both configurable by item) but, more important, by the scoring engine used to score the response.

Our system includes a very powerful and flexible mechanism for test developers to define highly interactive "simulation" tasks. The test developers can choose from many standard web input widgets and can define output that can (a) drive an animation and (b) populate a table. These interactive "simulations" can be offered

as a mechanism for students to explore or experiment with the simulated phenomenon. If the Department chooses, student interactions can be captured and scored—for example, the Department can evaluate the quality of an experiment represented by a sequence of trials.

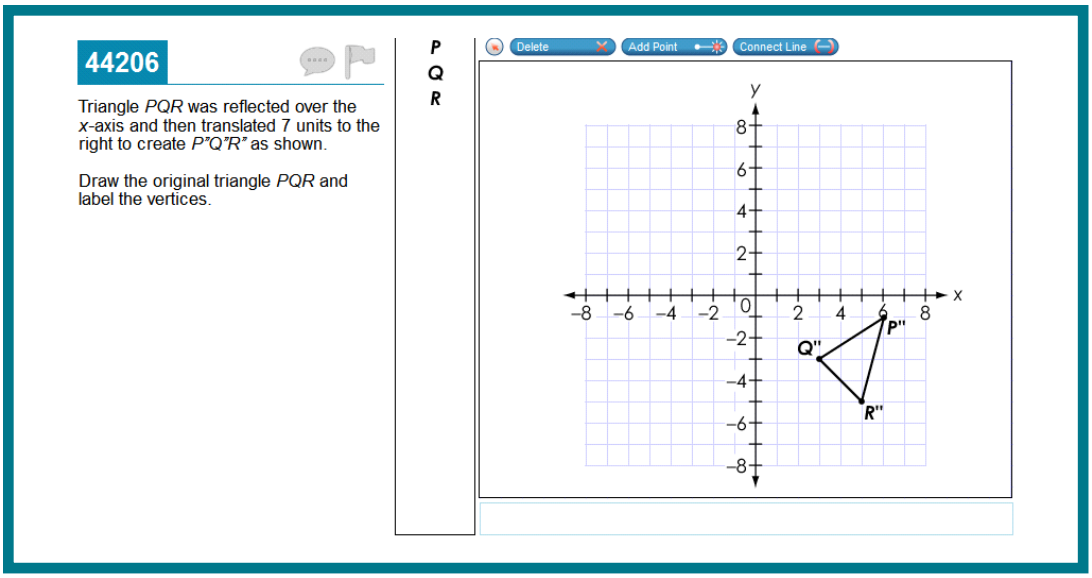
Our system is capable of capturing speech and routing it to our scoring system. We have not included such items in this proposal due to the logistical requirements, which may be prohibitive. Specifically, each student would need headphones with a microphone. Testing would have to be administered on an individual or small-group level in order to minimize the noise and distraction in the room (imagine 30 students all speaking at the same time in the testing setting). However, we mention that we have this capability in operational use, and we are happy to negotiate the inclusion of items that use it if the Department finds the capability attractive.

As previously mentioned, our scratch-pad response provides students the tools necessary to express mathematic reasoning in much the same way as they might on a paper-and-pencil test. The very flexible and open-ended nature of this response mechanism dictates that responses using it be human scored, at least in the short term.

The availability of tools organized around response mechanisms creates a very flexible capability for test developers to create authentic, challenging tasks. The sample items below illustrate the flexibility that these tools offer test developers to create authentic, challenging tasks that probe the full range of depth of knowledge.

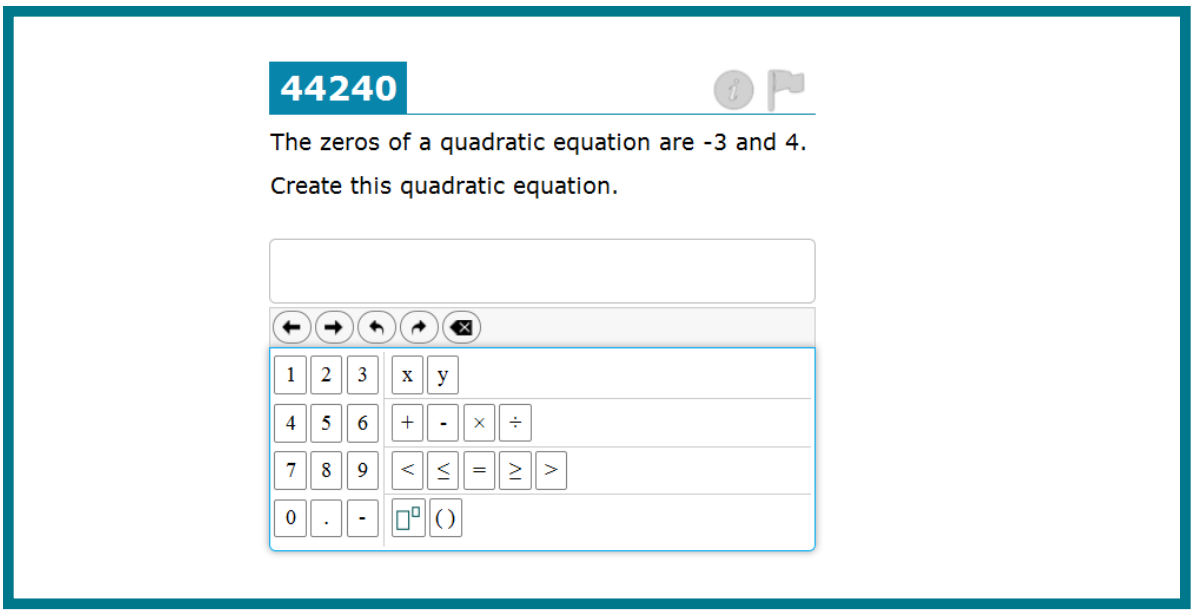
Exhibits 7.4.9.9-1 and 7.4.9.9-10 present sample items illustrating some of the item types that our system can deliver. Readers may notice that some of the examples come from the Smarter Balanced Assessment Consortium—these are, in fact, released items that AIR delivers for Smarter Balanced through our system. These samples are designed to illustrate the types of items that we can support. For some examples of the types of items being proposed for the Department and the ways that we propose to measure the standards, please see the sample items in section 7.3.1.

Exhibit 7.4.9.9-1: Graphic-Response Item



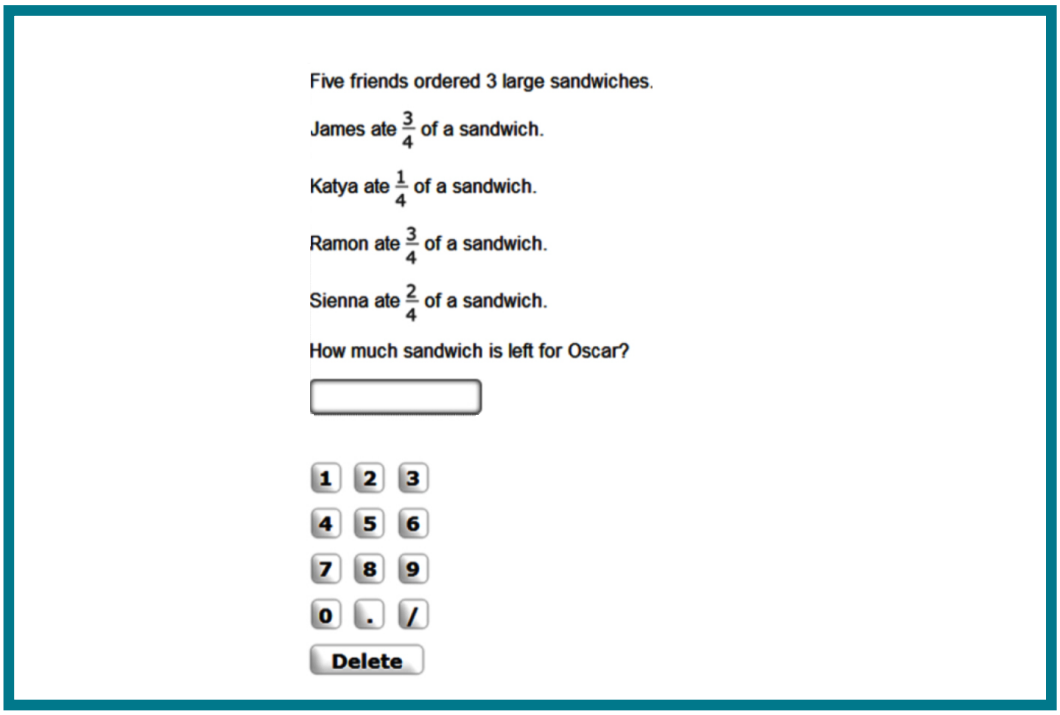
In this example, students respond by plotting points and connecting lines to create a triangle. The response is completely machine scored based on the location of the triangle that is drawn. The scoring assertions allow for partial credit based on a possible incorrect transformation.

Exhibit 7.4.9.9-2: Equation Response Item



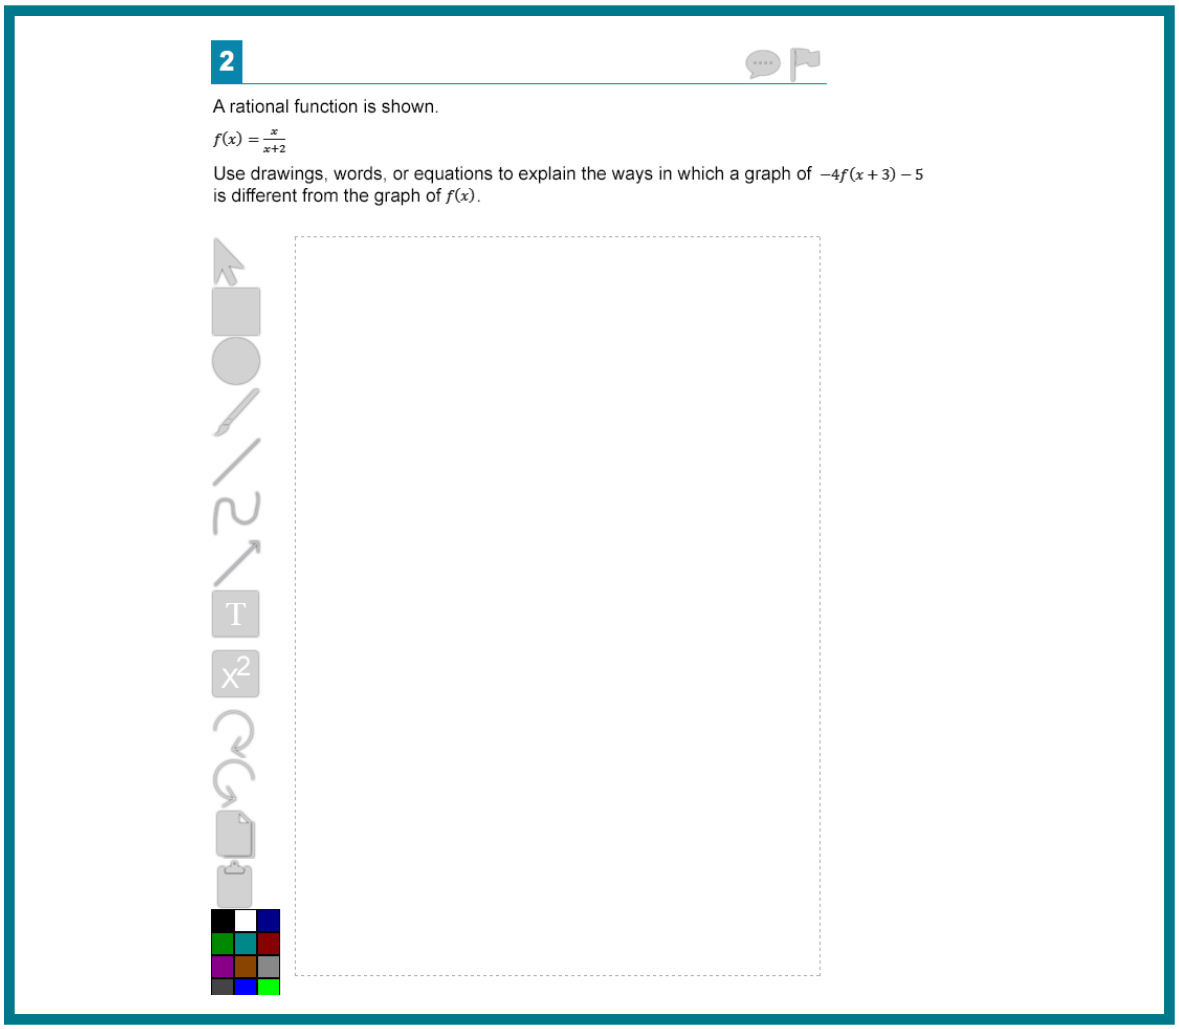
In Exhibit 7.4.9.9-2, students respond by creating an equation using the equation editor. The functions available to the student on the equation editor are completely configurable and can include everything from simple operators to trigonometric functions and integrals. These types of items are machine scored.

Exhibit 7.4.9.9-3: Equation Editor Items



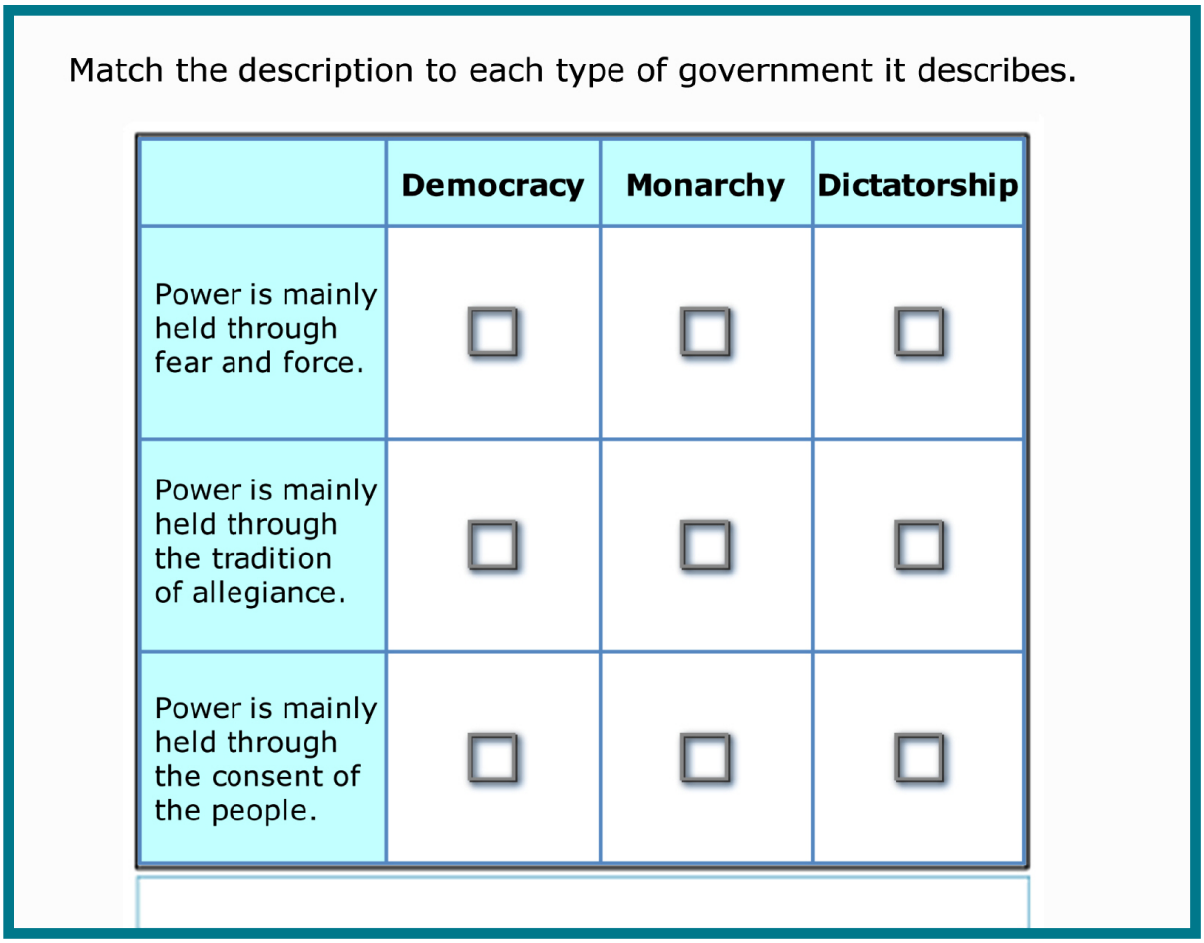
In the constructed-response example in Exhibit 7.4.9.9-3, students respond by entering the correct number using the physical keyboard or virtual keypad. These items can be scored either using the equation editor, which requires correct mathematical input but will match any equivalent form, or using a string-matching algorithm that enumerates potential correct matches. The latter capability can be helpful in lower grades where the content may not demand mathematical precision.

Exhibit 7.4.9.9-4: Scratch-Pad Response Item



Scratch-pad responses, as seen in Exhibit 7.4.9.9-4, are generally used for Mathematics items. Students are given a set of tools that enable them to integrate drawings, mathematical equations, and words to provide a response. This very open-ended response mechanism can be effectively used to have students describe a situation or explain an answer. Scratch-pad responses are human-scored.

Exhibit 7.4.9.9-5: Matching Item



The item seen in Exhibit 7.4.9.9-5 is a type of selected-response item using the QTI *match* interaction. This rendering of the matching item is designed to be accessible to all students, including those who have limited or no vision. A traditional representation of a matching item in which students draw a line between matched elements is not accessible. Here, the relationship is indicated by marking the cell of the table. The table is accessible to screen readers and is entirely keyboard navigable. Universal design principles suggest using this rendering for all students.

Exhibit 7.4.9.9-6: Hot-Text Item

Read this excerpt from the Anti-Federalist Papers. Then read the following four amendments to the Constitution.

Highlight a concern from the Anti-Federalist argument.

"For the purpose of securing the property of the citizens, it is declared by all the States, that in all controversies at law, respecting property, the ancient mode of trial by jury is one of the best securities of the rights of the people, and ought to remain sacred and inviolable.

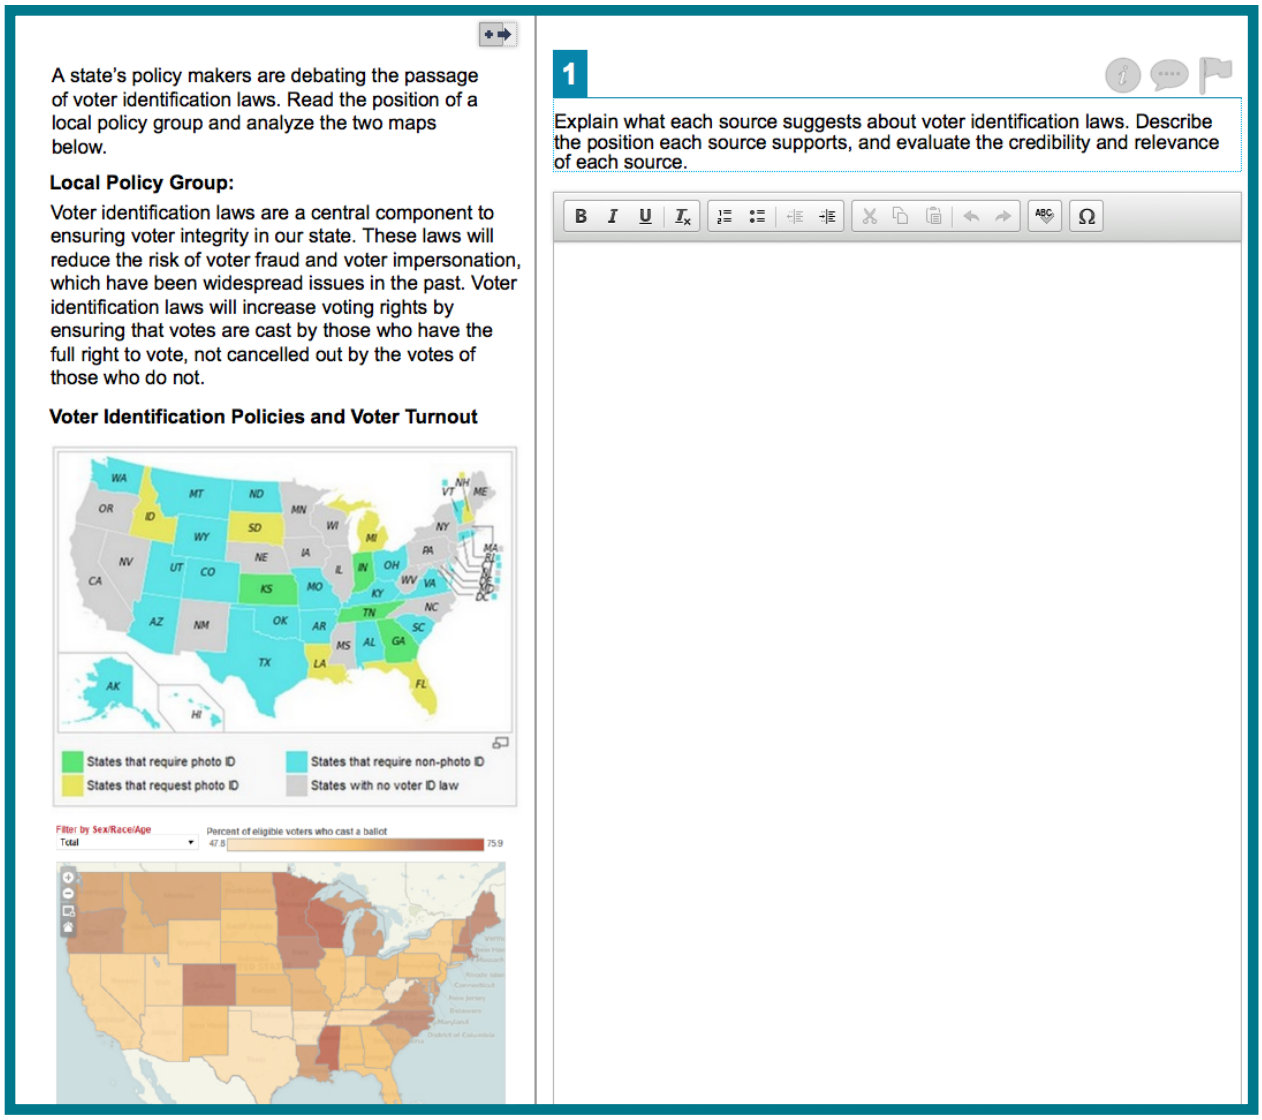
"Does not the same necessity exist of reserving this right under their national compact, as in that of the States? Yet nothing is said respecting it.
In the bills of rights of the States it is declared, that a well regulated militia is the proper and natural defense of a free government; that as standing armies in time of peace are dangerous, they are not to be kept up, and that the military should be kept under strict subordination to, and controlled by, the civil power."

Then, highlight a portion of the first four amendments that addressed the Anti-Federalist argument.

Amendment 1. Congress shall make no law respecting an establishment of religion, or prohibiting the free exercise thereof;
or abridging the freedom of speech, or of the press;
or the right of the people peaceably to assemble, and to petition the Government for a redress of grievances.

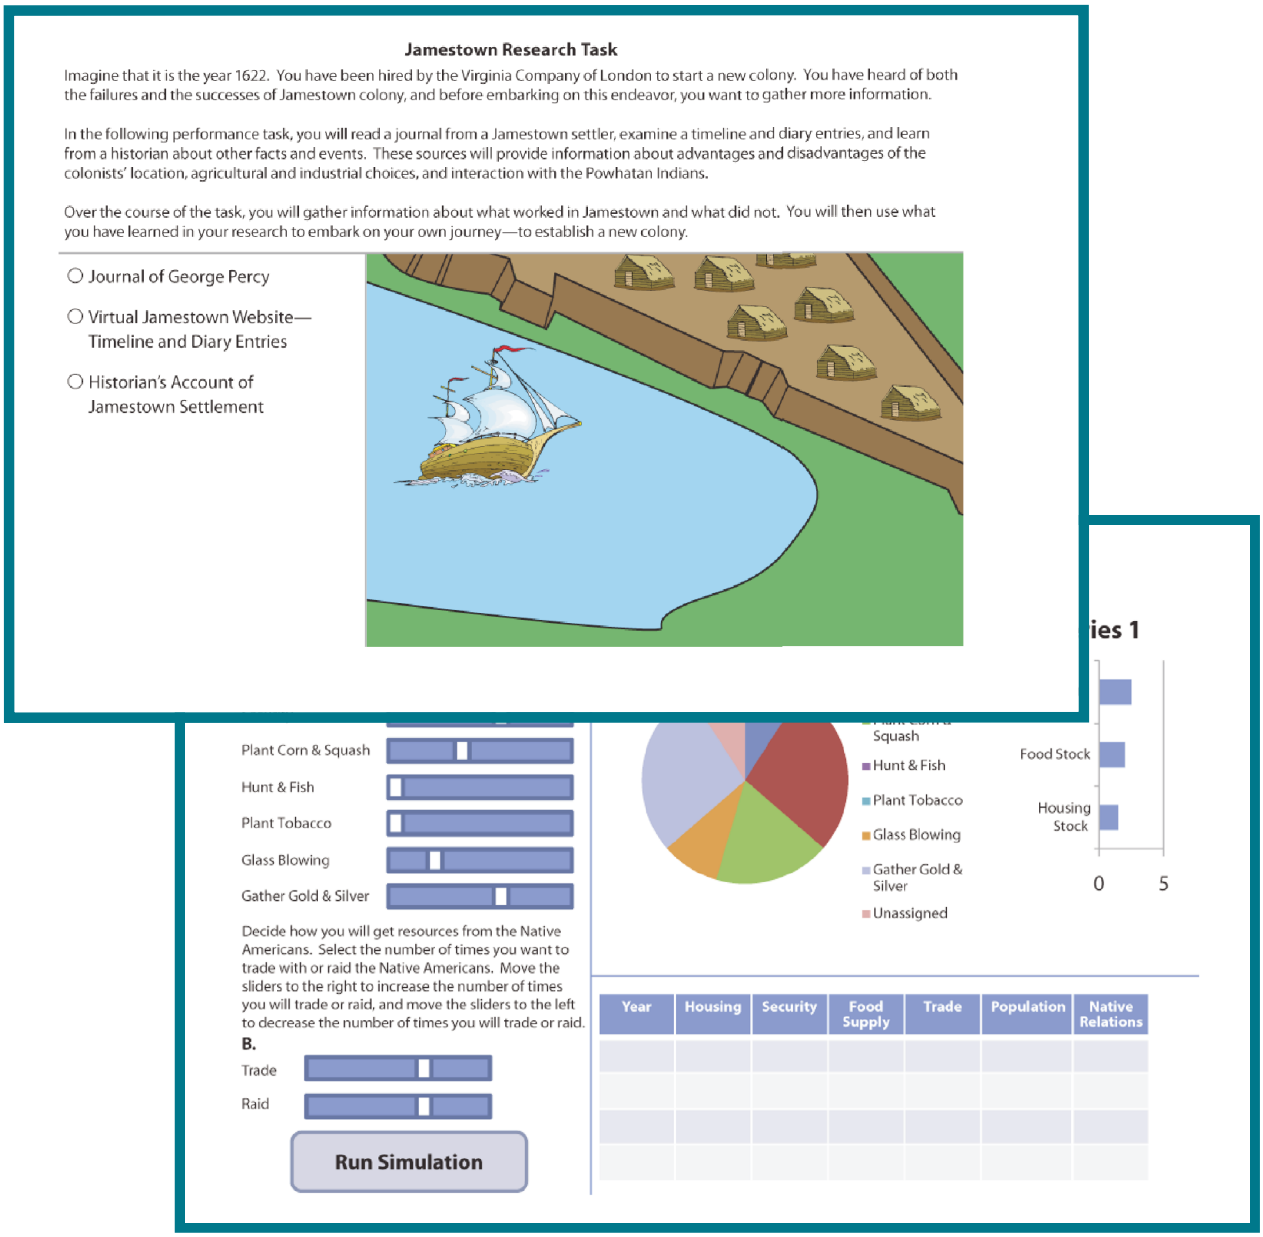
In the example seen in Exhibit 7.4.9.9-6, students respond by selecting sentences or phrases from the paragraph. These items are often used in English Language Arts/Literacy (ELA/L) to identify evidence for statements within a text. Here, it is used to express an analysis of an argument in a historical text. These types of items are machine scored.

Exhibit 7.4.9.9-7: Extended-Response Item



In the example in Exhibit 7.4.9.9-7, students respond by providing a long written response to be scored using an essay-scoring engine or a mix of machine and human scoring. Notice that students are offered a variety of writing tools.

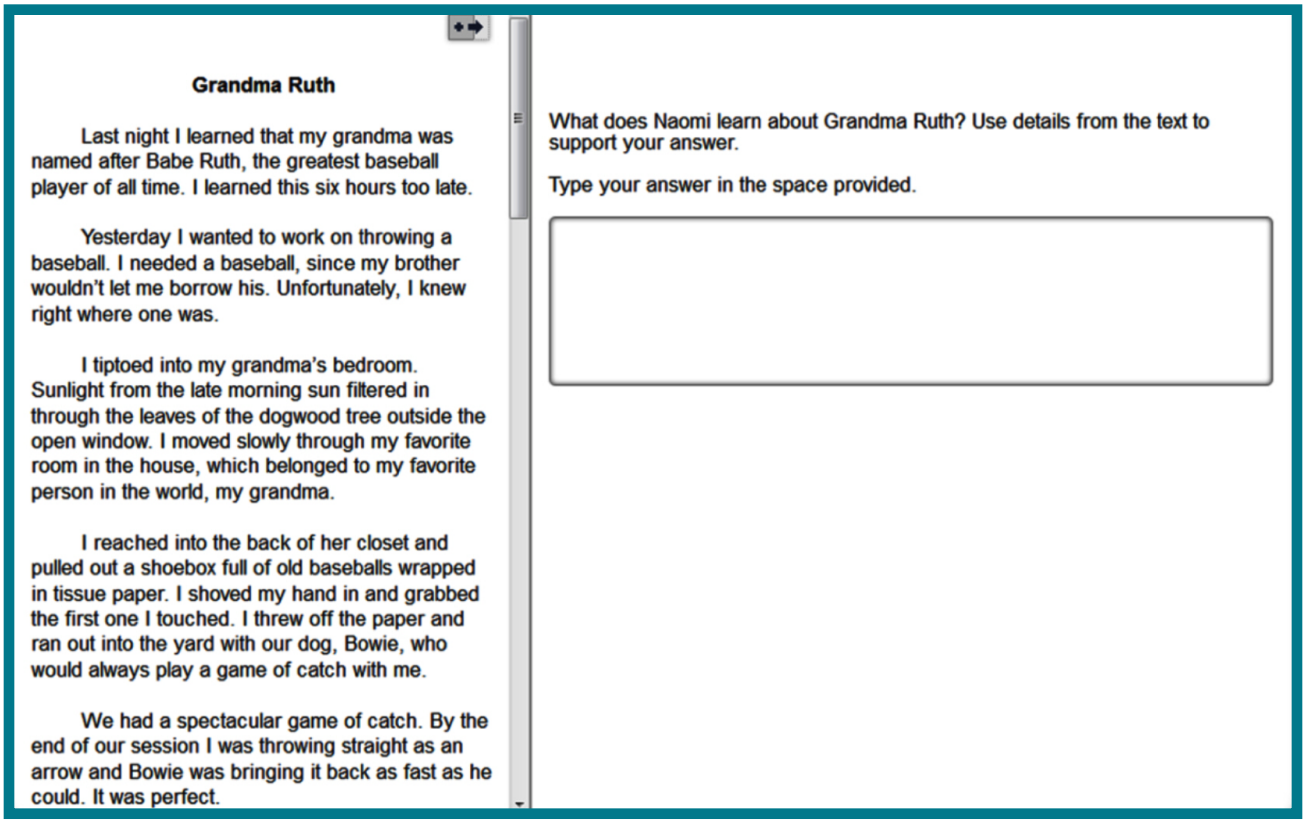
Exhibit 7.4.9.9-8: Simulator Interactions Item



AIR's unique simulation technology creates items that enable students to meaningfully interact with a virtual environment. This interaction can be used as a stimulus for other items, the interactions can be captured and scored, or both. In the example in Exhibit 7.4.9.9-8, students are scored on their interactions with a simulator. Students are presented with several stimuli, which provide the information they need to make decisions within the task. Students are scored on the sequence of decisions they make in response to conditions that arise in the simulation.

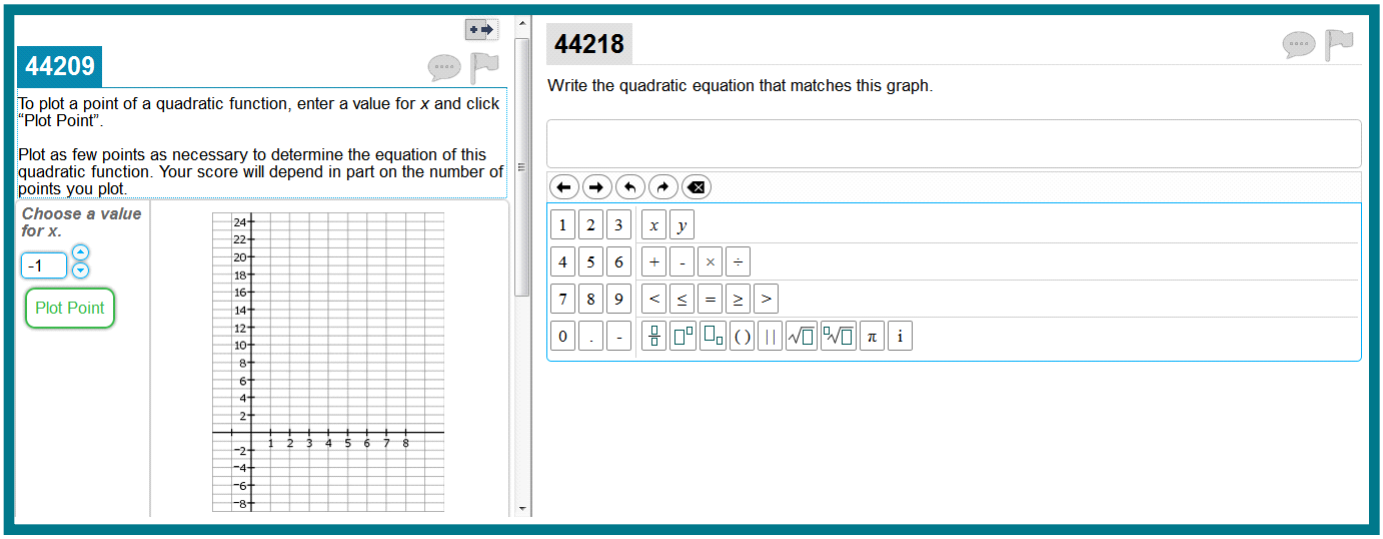
In this example, students use sliders to indicate allocations of resources. The pie chart and table to the right are populated in real time based on the student's interaction. In this type of item, students can be scored based on their choices during the simulation, rather than on the outcome alone.

Exhibit 7.4.9.9-9: Proposition Response



In the example in Exhibit 7.4.9.9-9, students respond by answering a question and providing details from the text to support their answer. This machine-scorable item uses our Proposition Scoring engine to recognize correct propositions in the student response.

Exhibit 7.4.9.9-10: Simulator Interactions Item



In this example, students first respond by interacting with a simulator and then by entering an equation. With the Simulation, students are able to interact with data and provide responses in varied formats. These responses can be machine-scored. Responses can also be scored based on the sequence of interactions conducted by the student. Note that this example is entirely machine-scorable.

7.4.10 Customer Service and Technical Support

Easily accessible, prompt, and accurate customer support is essential to success. AIR commits to providing a toll-free customer support line, chat service, and e-mail for state users, educators, and administrators Monday through Friday from 7 a.m. to 8:30 p.m. Eastern time. AIR's help desk software (Contactual, 8x8 Inc. software, version 7.0.0) integrates voice, e-mail, and chat functions. A user can call the help desk on a dedicated number, e-mail a dedicated e-mail address, or initiate a chat with one of our customer service representatives.

The help desk will offer support to Florida educators through e-mail and chat as well as the toll-free number and will be staffed with agents who are knowledgeable about the Florida assessments. The help desk will be available to answer all questions about Florida's testing system. Examples of types of support include installing the secure browser, using the system, resolving system access issues, and processing special cases such as test invalidations or test resets. The help desk staff will be able to identify questions that are matters of policy and belong to the Department and those that are to be answered by AIR staff.

Description of Help Desk Operations

Our experience transitioning state departments of education from paper-pencil testing to online administration has taught us that easily accessible, prompt, and accurate customer support is essential to success. Our help desk operations are designed to provide

- flexibility to meet peak call times throughout the year;
- strategic monitoring of all help desk activity through daily, weekly, and monthly reports;
- a tiered-level approach to escalating and resolving each query quickly and efficiently; and
- consistent responses to multiple calls about the same issue by providing an electronic repository of FAQ documents, guides, manuals, and other resources that all Florida help desk agents will refer to. These documents will be developed in consultation with the Department.

Providing Customer Service during Peak Times

AIR commits to providing customer service throughout the year, during peak times and with additional staff as needed during testing. From our experience in Hawaii, Delaware, Oregon, and Minnesota and with the Smarter Balanced Pilot Test we typically experience high call volumes three to four weeks before the test window opens and during the first few weeks of any test administration window as test administrators use the system for the first time. Our preparation for peak times routinely involves targeted training support for help desk representatives (this is described in more detail below) and, when needed, additional customer representatives are added to support call volumes.

Monitoring Call Activity

AIR logs all communications to the help desk regardless of whether an issue is resolved on the spot by a help desk representative or is escalated to Tier 2 for further investigation. In addition to summarizing the communications in a help desk log, all communications are preserved in their original state. For example, original e-mails and faxes from the field are saved and can be retrieved in moments. All

chats are recorded and stored in the case notes. All phone calls from the field are recorded, are linked to the help desk case number, and can be easily retrieved for an extended period of time if necessary.

When the help desk is contacted, a ticket is opened in the Contactual 8x8 system. The following information is recorded when a ticket is opened:

- A unique, dynamically generated case number
- The caller's contact information
- The help desk lead
- The team member currently assigned (if the issue is escalated)
- Origin (if there are multiple cases regarding the same topic)
- Situation summary
- Status of the request (e.g., escalated to Tier 2, resolved)
- AIR system (e.g., Test Delivery System, TIDE)
- Local computer information (e.g., hardware, software, network setup, browser)

Supporting documentation is also attached to the ticket. Additional fields can be collected if required.

In addition, AIR's Help desk is supported by highly configurable support center software. In addition to the case entry and reporting features, the software permits supervisors to monitor live calls to each representative, monitor the call queue, record calls, review performance metrics in real time, and retrieve historical case histories sorted by caller.

All calls, chats, and e-mails are logged into the Contactual 8x8 system, where they are monitored daily by help desk management. With this software, our help desk management and project team generate monitoring reports providing a range of metrics for the project team to identify issues that may require higher-level expertise to resolve or patterns in the types or frequencies of calls on particular system features.

For example, in our experience, most help desk calls are from users who are unfamiliar with the system and need assistance. Successful training and the online availability of thorough system documentation and support in the testing system typically keep these requests to a minimum. The few help desk calls that require technical assistance tend to relate to problems with the user's local infrastructure. These include firewall problems and local network Internet connectivity and are escalated to AIR's Tier 2 network staff for follow-up and resolution.

Tiered Approach to Case Escalation and Resolution

AIR implements a tiered approach for the help desk to escalate and resolve questions from callers:

- The first tier (Tier 1) consists primarily of scripted answers approved by the Department and the resolution of routine queries by help desk agents. Roughly 85% of all calls are resolved at Tier 1.
- The second tier consists of a help desk representative escalating a case to a member of a user support team (Tier 2) for further investigation. Each team specializes and has areas of expertise that allow them to quickly resolve cases assigned to them, e.g. network support, TDE testing support, reporting. If the issue cannot be resolved at the Tier 2 level, it will be escalated to a senior subject matter expert.
- Tier 3 consists of contacting a subject matter expert, such as a network engineer or a senior development engineer.

To ensure that cases are resolved quickly and efficiently at the Tier 2 level, AIR relies on dedicated employees whose function is to coordinate and facilitate the resolution and closure process for all Tier 2 cases. This position serves to closely track open cases, working hour to hour with Tier 2 staff to obtain accurate and timely information and to secure additional technical or program management support as necessary until each case is resolved.

The AIR Help Desk is open throughout the entire year and will respond to calls received at any time. AIR will have Tier 1 and Tier 2 staff available beginning not less than four weeks before and extending one full week after each test administration. Additional customer service personnel staff will be available to handle computer-based test administration calls. The AIR Tier 2 personnel will be skilled and able to provide advanced technical support and will be available during the hours that the help desk is open. The AIR Tier 2 staff will be immediately available to handle issues that cannot be resolved by the Tier 1 help desk staff.

In situations that require information from the Department, the customer service representative or member of the project team will contact a designated Department staff member by e-mail and follow up via phone, and this staff member will locate the answer to the query.

Ensuring Consistent Responses

Ensuring accuracy and consistency in responses from the help desk is critical to establishing confidence in Florida educators and administrators. To achieve this, all agents are presented with standardized training, tools, and scripts to provide consistent responses. First, agents are provided with easy-to-use scripts that guide these agents to ask each caller the questions necessary to diagnose the issue quickly. In situations in which the case requires escalation the agent will gather the information necessary and inform the caller that the issue will be escalated to the next level of expertise, Tier 2.

Customer service staff will document all communications in a log and furnish it daily to the Department during each administration or on request as needed. Under the guidance of the Department AIR will develop a call topic matrix consisting of a set of scripts to ensure that calls are responded to in a consistent and appropriate manner.

In addition, each agent has access to a state-specific document repository. In responding to queries from Florida educators and assessment coordinators, all Florida help desk agents will access the Florida-specific FAQs, manuals, user guides, and training materials and will use them in their responses as appropriate. To ensure that agents are providing current information, the FAQs will be updated regularly by the project team, approved by the project director, and provided to the Department. The four-part training program completed by all help desk agents (described in the section below) further ensures consistency in responses.

Training and Supervision of Customer Service Representatives at the Help Desk

AIR's training of customer service representatives at the AIR help desk is based on our experience in assisting new users in in Hawaii, Delaware, Minnesota, Oregon, Ohio Online Pilots, Smarter Balanced Small-Scale Trials, and Smarter Balanced Pilot Tests with varying degrees of technical knowledge in the use of an entirely new online testing system. Our past experience has shown that callers may not know enough about the online testing system to articulate the specific system issue they have encountered. Therefore, our customer service agents must be able to guide callers

through a series of questions designed to diagnose the issue quickly.

In addition, our past experience reveals that many callers simply want someone to walk them through the step-by-step instructions provided in the system documentation. AIR's customer service agents are trained to provide this level of support to educators and administrators wherever required.

Finally, analysis of past help desk logs shows that customer queries tend to be divided into three distinct categories corresponding to three stages of the online administration:

1. Questions about online testing **preparation** (these include questions about scheduling online test sessions, training test administrators on online procedures, and installing secure browsers)
2. Questions during the **start-up** or beginning of the test window (these include queries about using the system, setting accommodations, understanding participation counts, and understanding how to create class rosters)
3. Questions during the **ongoing** administration (which tend to include resolving questions about system access, test invalidations, test resets, and resolving issues involving network latencies)

Based on the type of customer queries we typically receive, AIR's customer service representatives must complete a rigorous four-part training program that involves the following:

1. Training on the functionality of each component of the online testing systems as well as the paper testing program including the policies and procedures set forth in user guides and manuals
2. Training based on past logs of customer queries taken from each stage of an online administration: preparation, startup, and ongoing administration
3. Training on the use of detailed scripts that enable the customer service agent to ask callers a series of questions and thereby quickly diagnose the system and point of issue with which the caller is experiencing difficulty
4. Project-specific training on each aspect of the state's assessment program (All Florida help desk representatives and Tier 2 staff will complete Florida-specific, project-specific training sessions covering all Florida assessments. The sessions will outline commonalities and differences across each Florida assessment and highlight the major test administration requirements of each.)

In addition to providing rigorously trained customer service agents, AIR's help desk is supervised and monitored by a full-time management staff responsible for monitoring response accuracy. Supervisory staff audits calls to the help desk to ensure that help desk agents are providing accurate information. When a question of possible inaccuracy arises, the help desk management staff will obtain a copy of the phone recording or chat log and can confirm whether the information provided was correct.

AIR's policy is for the project director to report any system-wide issues directly to the Department.

Help Desk Quality Assurance Plan

By closely monitoring the resolution time metrics, the project team can identify how quickly our agents and Tier 2 support are providing answers to the field. As explained below, the daily summary report allows the project team to pinpoint exactly which cases associated with which system and team are taking longer to address.

In addition, the daily help desk report can function as an early warning system pointing

to an area about which assessment coordinators may need more clarification. For example, if there are a series of calls about performing a test reset or obtaining a new password, this can alert the project team to the need for further explanation. In such situations, the project director will alert the Department of the issue. Together, the project director and Department staff can determine whether a clarifying document or communication is required.

An integral component of AIR's help desk quality assurance plan centers on the project team analyzing the metrics provided in detailed daily and on-demand help desk reports. The Contactual 8x8 system uses job tickets as the primary method of tracking issue types, status, and individual client trouble calls and e-mails, and the AIR help desk reporting system includes current aggregate status information for various resolution types, as described below.

Quality assurance for help desk support requires daily monitoring of all help desk activity by AIR's project team, the help desk manager, and the help desk supervisory staff. The daily report provides much of the information necessary to make this possible, including the following:

- The date and time of each call, chat, or e-mail
- The name of the Tier 1 agent taking the call and/or providing resolution
- A case tracking number
- The name of the team to which the issue has been escalated to (where appropriate)
- A description of the issue
- The caller contact information
- A detailed description of the activity taken by the agent and/or the next level of support to resolve or investigate the issue
- The length of time the case has been open
- Whether the incident caused a student test session to be interrupted
- The date and time the issue was resolved
- Status (whether the agent is waiting for a call back from the caller; whether the case is under investigation; whether the team is waiting for additional documentation from the user)

A sample of the help desk daily report follows this subsection as Exhibit 7.4.10-1.

The project team also manages the test administration by reviewing the case analysis summary report, which includes the following information:

- The volume of cases open and closed for the requested time period
- The number of cases assigned to specific systems
- The number of cases assigned to specific Florida tracking categories, which include:
  - The average and median time it takes to close a case
  - The longest time a case has remained open
  - The shortest time it has taken to close a case
  - The percentage of cases that have been escalated to Tier 2
  - The percentage each category contributes to all cases
  - The specific Tier 2 support team that currently holds the case, allowing the project director to see where the bulk of cases currently reside

A sample of the Case Analyses Summary is included at the end of this subsection in Exhibit 7.4.10-2.

In addition our help desk staff and project director have access to the following:

- Average hold times by day and hour
- Number of dropped calls
- Average time on hold before calls were dropped

The project team uses this information to quickly identify the stage or status of open cases, which system those cases involve, how long the cases have been open, and the best way to facilitate speedy resolution. AIR will provide the Florida staff with detailed help desk reports daily or at preset time intervals. The reports will include the information described above to help inform Florida staff of the help desk activities.

The project team uses these reports to track types of calls and ensure timely resolution of all issues. During AIR's first year transitioning four separate Minnesota assessment programs to the new online testing system, our help desk received approximately 10,000 calls from Minnesota educators and administrators. Approximately 80% percent of these cases were resolved during the initial call or e mail to the help desk. Our help desk opened and logged more than 21,000 cases in support of the Smarter Balanced pilot administration and approximately 85% were resolved at Tier 1.

By closely monitoring the resolution time metrics, the project team can identify how quickly our Tier 1 and Tier 2 support teams are providing answers to the field and resolving open cases. As previously explained, our summary reports allow the project team to pinpoint exactly which cases are associated with which system and what type of cases are taking longer to address. The project director and the help desk manager work closely together to decide the best way to facilitate an immediate resolution.

In addition, the AIR help desk reports can function as an early warning system, pointing to an area in which assessment coordinators may need more clarification. Together, the project director and the Florida staff can determine whether a clarifying document or communication should be provided for the field.

7.5.0 Scanning, Scoring, and Reporting

7.5.0 Scanning, Scoring, and Reporting

In this section of our proposal we present our plans for scanning, hand-scoring, test scoring, reporting, data cleanup, and delivery. The following individual sections describe the details of our plans, but we would like to call your attention to four aspects that will provide significant value to the state of Florida:

- We have partnered with Data Recognition Corporation (DRC) for the scanning and hand-scoring aspects of this contract. Among the test processing organizations with sufficient capacity to process the Department's tests on its tight timelines, DRC is the only organization to have received International Organization for Standardization (ISO) certification for all of its testing processes. This certification ensures the Department that DRC implements replicable processes for every phase of test processing, offering a level of quality unsurpassed in the industry.
- In addition to PreID processes, we offer a "real-time-ID" process for mobile students, allowing every student to have an identifying label. This capability offers improvements in data quality that result in vastly reduced timelines and enables us to begin data cleanup even before the tests are complete.
- We offer dual-mode reporting, offering paper to parents and online reports (even real-time online reports at your discretion) to educators. Interactive online reports can convey infinitely more information than paper or fixed-PDF reports, enabling educators to explore the implications of their data for their students, slicing and dicing the data at will.
- Our report design has involved cognitive scientists, psychometricians, and communication experts to ensure that our industry-leading, full-color reports convey information in a way that is clear and appropriately interpreted by the intended audiences. We have appended samples of our paper reports from Hawaii, including annotated screenshots of our online reporting system, in Appendix G.

We hope that the Department agrees that our innovative plan, drawing on technologies and approaches that have succeeded elsewhere, will exceed its requirements and help the Department continue its track record of continuous improvement.

7.5.1 Scoring and Reporting Specifications

Introduction

The Department's process for documenting scoring and reporting decisions follows almost identically with AIR's standard recommended process. AIR typically develops three documents that are relevant to operational scoring and reporting:

1. Handscoring specifications, which detail such processes as backread rates, reliability read rates, target reliabilities, validity paper relative frequency, and rescore criteria. These specifications are detailed in Section 7.5.4.5.
2. Analysis specifications, which detail the specifics of the calibration and equating process that will yield the item parameters and the transformations that will place the scores on the Florida Standards Assessment (FSA) scale. These specifications, which also include item analysis details, are discussed under Section 7.6.2.
3. Reporting specifications, which detail all of the aggregations, transformations, filters, visual displays, and other characteristics of the reporting. The reporting specifications are detailed in this section.

While the ITN refers to "scoring and reporting specifications," we have found that breaking the document into three parts simplifies review and maintenance. All three documents require the attention of project management and psychometricians. The handscoring document requires input and review by the scoring team, and the reporting specifications require input from the reporting team with more expertise in communication. We hope that the Department sees the value in this modularization of the specifications document. Of course, all three parts can be integrated into a single, three-part document at any point.

AIR has a long history of successfully developing and maintaining scoring and reporting specifications to ensure that final reports and data files are produced accurately and on time. We rely on our specifications documents to capture detailed business and processing rules that enable AIR staff to conduct critical quality assurance processes far in advance of receiving final data. By the time we receive final data from online and paper tests, all programming and system checks have been verified, independently replicated, and are ready to use. Our many automated procedures, including quality and data integrity checks to ensure quality of online and paper tests, scoring rubrics, data, and other products ensure that we are able to meet compressed timeframes and deliver final data files to our clients while maintaining 100% accuracy.

Should the Department decide to use AIR's online reporting system to provide data and reports to Florida schools and districts, AIR staff will work with the Department to finalize the online reporting specifications to configure the online reporting system, as well as specifications for the paper-report and scoring specifications. In this section we describe

- our proposed process for completing the specifications documents;
- the detailed rules we propose to include in the scoring and reporting specifications along with sample excerpts; and
- the quality assurance processes that rely on detailed scoring and reporting specifications to ensure accurate, on-time data file deliveries to our clients.

Proposed Process for Producing Scoring and Reporting Specifications

AIR will work with the Department to draft and finalize all reporting specifications documents required for the English Language Arts/Literacy (ELA/L) and Mathematics assessments and the End-of-Course (EOC) assessments. To facilitate this process, we propose conducting an on-site working session with Department staff to capture detailed business rules for each document. For example, to prepare for the working session to finalize the online reporting specifications, AIR staff will identify the decisions that the Department is required to make to configure each part of the online reporting system e.g., the Test Management Center, downloadable data files, definitions of measures, home page data displays). The project team will send the list of required decisions to the Department in advance of the meeting. During the working session, participants will proceed through the list to obtain decisions on each point. To provide context to this discussion, AIR staff will project images of the online reporting system that correspond to the specific rules being discussed. This will help Department staff visualize the impact of their decisions on the reports appearing in the online reporting system. Once the Department approves the specifications, AIR programmers will use the specifications document to configure the online reporting system and to conduct quality assurance checks to ensure the system is functioning as required.

To produce the 2014–15 scoring and reporting specifications for paper reports, AIR will use the 2013–14 scoring and reporting specifica-

tions provided by the Department along with the list of the Department's updates outlined in the ITN.

Proposed Plan for Completing the Scoring and Reporting Specifications Each Spring

The first draft of the scoring and reporting specifications documents will be produced each April as required by the Department. Project staff will be responsible for maintaining an addendum with updates during the year. AIR will submit the final specifications addendum at the same time as the last closeout file of student results for that year.

We recognize that April and May are typically high-activity months for the scoring and reporting staff and that, if not planned well, work on updating specifications documents scheduled for this timeframe can often be delayed. To mitigate these concerns, AIR will assign separate reporting staff members to the operational tasks and the planning/specifications tasks:

- ELA/L and Mathematics reports for educators must be delivered between the end of April and mid-May 2015
- ELA/L and Mathematics paper reports for families are to be delivered by June 8th, 2015
- Spring EOC educator reports must be delivered by the first week of May, 2015
- Spring EOC paper reports for families must be delivered by mid-May 2015

Despite the consecutive reporting deliverables scheduled for May, we are confident that project staff will be available to update the scoring and reporting specifications in April. AIR's integrated quality assurance (QA) systems have made it possible to automate many of the scoring and reporting QA processes and to conduct these QA steps far in advance of receiving the final data (see Section 7.5.5.1 for a detailed explanation.) As a result, key project staff, including the reporting manager and the lead psychometrician, are able to focus on updating scoring and reporting specifications for the upcoming year. In addition, AIR's scoring and reporting specifications process does not require participation from programmers and QA staff, who can instead focus exclusively on conducting last-minute regression tests on system functionality. Additionally, our experience has been that after the first year of the contract, updating online scoring and reporting specifications typically requires much less time than during the first year of the contract when systems need to be configured from scratch.

Next we present an overview of our scoring and reporting specifications documents and samples of the detailed rules that these documents contain.

Overview of Document Content

The online reporting specifications document defines the rules that govern system configuration, including table layouts, user-role access, definitions, reporting rules, and content hierarchies. Exhibit 7.5.1-1 provides a summary of the topics covered in the specifications along with a description of online reporting rules.

In addition to the online reporting specifications discussed in Exhibit 7.5.1-1, the reporting and scoring specifications specify rules for aggregating data, merging data, and handling special populations and discrepant records. Typically the reporting specifications include the following sections:

- Scope and Project Information (includes a summary of deliverables by Assessment and Administration)
- Schedule and Key Dates
- Schedule of Data Extracts
- File Naming Conventions

Exhibit 7.5.1-1: Summary of Topics Covered in Online Reporting Specifications

Topic	Description of Online Reporting Rules
Basic Information	Includes information to configure the home page of the online reporting system, specifies test instrument, grade, subject/course, and administration labels for the online reporting system.
Opportunities Per Test	For adaptive assessments, indicates the total number of opportunities available for each test to be reported in the online reporting system.
Definitions of Measures Reported	Includes calculation, aggregation, and exclusion rules for each measure. Examples of measures might be scale scores, conditional standard errors of measurement (SEM), performance levels, strand scores, strand- and benchmark-level strengths and weaknesses indicators, Lexile scores.
Reported Measures	Identifies for each grade, subject, and program the measures to be reported.
Reporting Subskills	Specifies all reporting categories/strands, clusters, and benchmarks/standards reported in AIR's online and paper reports.
Reporting Settings	Defines the labels and columns to be configured for each online reporting system report.
Theta to Scale and Cuts	Describes the detailed scoring rules for online and paper reports.
Test Codes and Condition Codes	Specifies all rules governing test and condition codes for processing and reporting.
Attemptedness Rules	Defines rules for attempted, incomplete, and not attempted tests.
Rules for Multiple Records	Specifies the reporting rules for situations where students can potentially take more than the allowed number of tests. For example, in a single opportunity test, it may be possible for a student to complete two opportunities, one online and another on paper. These rules specify which score will be selected for final reporting.
Performance Level Descriptors	Defines all PLDs reported in the student report.

- Data Processing Rules (including demographic and score data files required to produce paper reports, rules for handling invalidations and discrepancies, rules for data cleaning, rules for merging data files, rules for late-batch data processing)
- Rules for Special Populations (includes off-grade testers, home-schooled students, community schools, parent-exempt students, accelerated students)
- Rules for Constructing the Data for Paper Reports
  - Aggregation rules
  - Exclusion rules
  - Suppression rules
  - Roster inclusion rules
  - Address files
  - Truncation rules
  - Rules governing variable text (which text appears for test codes)
  - Rules for missing data fields
- Scoring Rules (includes attemptedness rules, cut scores, calculation rules)

The scoring and reporting specifications contain highly detailed calculations and statistical rules that allow our programmers and statisticians to set up and test their programs far in advance of our receiving final data. Exhibit 7.5.1-2 presents a few excerpts to demonstrate the specificity

Exhibit 7.5.1-2: Excerpted rule detail from some reporting specifications

Computation Rule: Theta Score (from Delaware scoring specifications)

The Delaware Comprehensive Assessment System (DCAS) test is based on the Rasch family of Item Response Theory (IRT) models. Multiple-choice items are scored via the Rasch model and the polytomous items are scored via Master's Partial Credit Model (Masters, 1982).

Likelihood Function

The likelihood function for generating the maximum-likelihood estimator (MLE) is based on a mixture of items types and can therefore be expressed as:

$$L(\theta) = L(\theta)^{MC} L(\theta)^{CR},$$

where

$$L(\theta)^{MC} = \prod_{i=1}^{N} \left[c_i + \frac{1 - c_i}{1 + \exp\left[-Da_i(\theta - b_i)\right]}\right]^{x_i} \left[1 - c_i + \frac{1 - c_i}{1 + \exp\left[-Da_i(\theta - b_i)\right]}\right]^{1 - x_i}$$

$$L(\theta)^{CR} = \prod_{i=1}^{N} \frac{\exp \sum_{k=1}^{x_i} Da_i(\theta - \delta_{ki})}{1 + \sum_{j=1}^{m_i} \exp \sum_{k=1}^{j} Da_i(\theta - \delta_{ki})},$$

where c_i is the lower asymptote of the item response curve (i.e., the guessing parameter), a_i is the slope of the item response curve (i.e., the discrimination parameter), b_i is the location parameter, x_i is the observed response to the item, i indexes item, and δ_{ki} is the kth step for item i with m total categories.

We subsequently find $\arg\max \theta\, L(\theta)$ as the student's theta (i.e., MLE) given the set of items administered to the student. Because this test is adaptive, each student sees a unique set of items; hence, no conversion table is used for scoring. Because this is a Rasch-based model, the following constraints are imposed for Delaware: $c_i = 0\ \forall\ i; a_i = 1\ \forall\ i;\ D = 1.$

Standard Error Transformation

Standard errors of the MLEs must also be transformed to be placed onto the same reporting scale.
This transformation is:

$$se(\theta') = \frac{s_a - s_m}{\theta_{a,c} - \theta_{m,c}} se(\theta)$$

The DCAS Reading and Mathematics tests contain test items measuring both on-and off-grade content. Science and Social Studies tests will contain only on-grade items. Multiple scores are estimated for each student, including two total scores (Reading and Mathematics only) and scaled scores for each reporting category.

- Let b_{sn} represent the complete set of items presented to student *s* including the on-grade and off-grade items;
- Let b_{sm} represent the subset of test items presented to student *s* including only the on-grade items; and
- Let b_{sq} represent the subset of items presented to student *s* in reporting category *q* including both the on-grade and off-grade items.

Rules Governing Records With Test Codes

The "VS" test code in the Publication File stands for Valid Score and should not be reported in the test_code field in superdata. For test codes values of INV, ABS, REF, ME, WG, NC, NA, all **fields should remain blank** in superdata.

- If test_code_r= INV, ABS, REF, ME, WG, NC, NA, or NE, then ensure the following values are blank: achievement_level_r, scale_score_r, raw_score_r, max_score_r, Lexile_score, Lexile_lower, Lexile_upper.
- If test_code_m= INV, ABS, REF, ME, WG, NC, NA, or NE, then ensure the following values are blank: achievement_level_m, scale_score_m, raw_score_m, max_score_m.
- If test_code= WG INV, ABS, REF, ME, NC, NA, then ensure the following values are blank: achievement_level, scale_score, raw_score_test, max_score_test, Lexile_score, Lexile_lower, Lexile_upper.
- If GRAD record test_code_grad= WG, INV, ABS, REF, ME, NC, NA, then ensure the following values are blank: scale_score_grad, raw_score_grad, max_score_grad.

For high school MCA-II, **if MCA test_code= WG, and GRAD test_code= VS** Publication File, then:

- For MCA record values: ensure subject level values are blank: achievement_level, scale_score, raw_score_test, max_score_test.
- For GRAD record values: ensure that in superdata: scale_score_grad, raw_score_grad, max_score_grad.

that allow us to conduct rigorous quality assurance early on. Excerpted rules include:

- Computation rules for theta score and likelihood function (from Delaware scoring specifications)
- Standard error transformation rule (from Delaware scoring specifications);
- Rules governing records with test codes (from Minnesota)

We propose to work with the Department to capture the same level of detail in developing scoring and reporting specifications for the ELA/L and Mathematics Assessments as well as the EOC Assessments. Next we describe how these detailed specifications documents are used to conduct QA procedures early on, assuring clients of error-free, on-time data files and reports.

Quality Assurance Processes That Rely on Scoring and Reporting Specifications

The purpose of capturing highly detailed specifications is to enable our programmers and statisticians to set up and test their programs before we receive final data. We have refined our specifications and quality assurance processes significantly so that when operational data is received, the majority of issues have already been identified and resolved. Below we describe these QA processes in more detail, including how they rely on detailed data layouts and specifications documents.

Quality Assurance Process for Data Processing and Psychometrics

Our quality assurance processes begin with our technical staff developing a data layout in which to receive scored data from our processing partner. AIR has developed an electronic layout format that drives a variety of programs, including programs that generate artificial data (used to test analysis programs) and programs that read or validate the incoming data. All of our statistical analyses that require raw data access the data by reading the same electronic layout file, eliminating any possibility for human error from cutting and pasting data layouts into different programs or version control problems created by updates to the data layouts.

With the data layouts defined, AIR's computer scientists generate simulated data files that are designed to model known and anticipated characteristics of the assessment data, as well as cases designed to evaluate the performance of the analysis, scoring, and reporting software under extreme or unusual conditions. These simulated data files are used to test all software supporting operational test analysis, scoring, and reporting, including performance of the data layout generator, data analysis software for computing classical item statistics and calibrating and equating test items, and conversion table generation, as well as all scoring and reporting software.

The software is tested and refined until it is error-free. This process happens well in advance of any operational data becoming available. Our test data generator is able to generate "challenge cases," including inconsistent data, missing data, out-of-range data, and other anomalies that mimic real-world complications. This testing and refinement phase ensures that we have anticipated any problems and have plenty of time to deal with them, should they arise, before the operational data arrive.

When the operational data arrive, we have all analyses replicated by two analysts to ensure that the programs are applied correctly. Any discrepancy in their results is thoroughly investigated and resolved. Resulting estimates, such as item parameters and conversion

tables, are compared with historical expectations in the belief that substantive changes may signal a problem.

Quality Assurance Process for Score Reporting

Online reports can appear in real time if the Department chooses. Therefore, quality assurance does not rely on post-hoc reviews of reports. Instead, the accuracy of the reporting system rests on the quality of programming of the system, the implementation of the Department's business rules, and the quality of the algorithms used for aggregating scores.

In building our systems, we undergo an extensive software testing process, and when we configure the systems for individual clients, we test them by running simulated or real data through the full system, allowing the system to generate reports. Our statistical programming team simultaneously implements the same rules and processes the same data. Statistics from the system are then compared to statistics produced by our statistical team. Discrepancies are tracked down and resolved.

As described in this section, this entire process is guided by a set of complete scoring and reporting specifications. Both the software team and the independent statistical programming team work from the same specifications, but each works independently. This process provides an independent check on the immediate reporting system before it is deployed. Of course, the Department is welcome to review the data at any time.

Quality Assurance—Statistical Programming

The family reports we propose to develop for the Department contain custom programming and require rigorous QA processes to ensure their accuracy. All custom programming is guided by the detailed and precise specifications in our reporting specifications document previously discussed in this section. Upon approval of the specifications, analytic rules are programmed and each program is extensively tested on test decks and real data from other programs. The final programs are reviewed by two senior statisticians and one senior programmer to ensure that they implement agreed-upon procedures. Custom programming is implemented independently by two statistical programming teams working from the specifications. Only when the output from both teams matches exactly are the scripts released for production.

7.5.2 Preparing School and Student Information

Introduction

One of Florida's long-held goals has been to move the testing window closer to the end of the year, extending the period during which students learn before testing. While it may be hard to imagine, the seemingly mundane process of gathering student registration data can have a substantial impact on these timelines. Cleanup of student data and redirecting reports to the right schools takes weeks under the current process. AIR and our partner, DRC, propose a process that will shorten these timelines while improving data quality. Any time saved cleaning things up on the back end can be reallocated to allow testing later in the year.

Our plan will make paper testing almost as efficient as online testing, vastly diminishing end-of-window cleanup and the reconciliation process. We begin by contrasting typical online programs from their paper counterparts. Online programs must authenticate students, and doing so requires that they have reliable student information before testing. When

everything is done online, adding a student to the roster at the last minute is a simple matter.

The Challenge

Until now, this has not been the case with paper tests, which, of course, must be printed and shipped—manufacturing activities that take some time. To pre-identify the booklets (or labels) with student information requires that the information be known early enough to print and ship. Students move around with some regularity, resulting in approximately 10 percent of the tests not being pre-identified. These students are accommodated using blank booklets, with their identifying and demographic information being bubbled by school or district personnel.

Under a typical system the student information is not discovered until the booklets are returned to the processing center and scanned. The weeks that the answer documents are in transit or being processed are weeks that cannot be used to clean up the data. The bubbling process ensures that the cleanup required will be extensive because hand-gridding the demographic information is tedious, labor intensive, and error prone. These errors must be individually resolved once the data become available.

Our Solution

The delays described above do not occur in most online programs. The reason for this is that the online programs must authenticate students *before* testing. The need to authenticate students leads to processes in which students are properly and positively identified before testing.

AIR and our partner, DRC, propose to eliminate bubbling on answer documents. Instead, our online registration system, the Test Information Distribution Engine (TIDE), will allow schools and districts to add students to the registration system in exactly the same way that students are added to our online registration system. Once added, the user will be able to print scannable pre-ID labels, on label stock provided along with the user's booklet shipment, using any laser printer. These labels, which might better be called real-time-ID labels, provide a mechanism to register students who show up at the last minute. Furthermore, once real-time-ID information is entered, it is available in cleanup systems, so that demographics, student-school associations, and other key data can be verified during the testing window rather than afterward.

AIR's TIDE system allows the real-time-ID information to be entered individually through an interface or through a file upload matching the pre-ID file format. The information is subject to the same set of validations as pre-ID files. From a policy perspective, this process depends on the state requiring each student to have a valid statewide ID prior to testing, which is a typical requirement for online programs as well.

Overview of Proposed Plan

AIR maintains a single, integrated system for managing test administrations, whether online or paper. This system, TIDE, is described in detail in Section 7.4.8.

TIDE interfaces with our Roster Tracking System database, which maintains information about each entity in the educational system, its *attributes*, and the relationships among these entities, which include the state, districts, schools, teachers, classes, and students. We propose to populate the district and school information directly from Department-supplied lists.

TIDE accepts inputs or uploads from authorized users. Hence, for example, district users may upload pre-ID files. Upon upload, the files

undergo both syntactic and semantic validations, which can be customized to Florida's needs. Typical validations include confirming valid district and school identifiers associated with students; valid values for names, grades, etc.; comparisons to historical data; and other validations. Our team will work with the Department to identify and document the required set of validation rules.

We generally open the TIDE window well before testing, and leave it open beyond the testing window. To support the printing of pre-identified test booklets, we will work with the Department to establish one or more dates on which we will take a snapshot of the data to compose the pre-ID files.

Throughout the testing window, TIDE offers the ability to check and revise student demographics, student-school associations, reporting schools, or other information that may change or require correction. Districts can view the student information directly through TIDE, and can implement corrections either through file uploads or through the interactive user interface.

As described above, this system enables districts and schools to easily accommodate late arriving students, even for paper testing. Where paper tests are in use, users will be able to print out real-time-ID labels on AIR-provided label stock.

By eliminating the bubble-scan-cleanup loop, our process can foreshorten the processing time after the testing window. In fact, most of the cleanup can be completed online before the testing window even closes. Many states establish a date after which cleanup changes are no longer accepted, and TIDE can enforce such dates, pulling the final data file immediately thereafter.

We note that TIDE also supports appeals and invalidations, which can be requested by authorized users through the same interface.

Specific Requirements

The process described above meets or exceeds all of the requirements set forth in the RFP. We discuss each of the enumerated requirements briefly below, and describe how it is accomplished under our proposed system.

1. Update Student Information between Scanning and Reporting

The contractor is required to ensure that school names and identifiers are correct following scanning. Much of this sort of cleanup is needed as the result of bubbling errors, which our process eliminates. We solve the problem of invalid school names and IDs by preventing their introduction in the first place.

Other cleanup is needed if districts or schools do not indicate all of the appropriate school relationships. For example, a student may be enrolled in one school, but attending an alternative school. In this case, both pieces of information would have to be entered into TIDE, either through a file upload or through an interactive interface. During the cleanup period (which can happen during the testing window), schools or districts can check to see that they are slated to receive the appropriate reports, and if not, they can add or correct the necessary data.

AIR staff will be available to assist in this review and cleanup.

2. MSID Validation

We propose to pre-load TIDE with Florida's official MSID data. We will accept updates only from the Department.

3. Initial and Updated Pre-ID Information

As described above, we propose to allow continuous updating of the pre-ID information by districts. We will work with the Department to establish one or more formal pre-ID dates on which snapshots will be taken to pre-print the books or labels.

Our real-time-ID process will enable all schools and districts to immediately obtain real-time labels through TIDE, eliminating the need to bubble information on the test booklets.

4. Pre-ID Windows and Business Rules for Processing File Uploads

AIR will implement the Department-established snapshot dates for pre-identification of students. As described above, the file uploads are subject to configurable validation rules. AIR staff will work with the Department to document the file validation rules, rules for accepting or rejecting records or files, and the final method for pre-identifying the answer documents.

5. Pre-ID File Layout

AIR will work with the Department to establish an appropriate file layout and update it as required for each administration. We note that we are able to include a wide variety of information in the pre-ID files, including the required accommodations.

6. Additional Steps to Ensure the Accuracy of the Pre-ID File

AIR will work with the Department to ensure that all of the necessary validation checks and processes are complete. These include the following:

- We will ensure that only valid, active MSIDs appear, the process for which is discussed above.
- We will ensure that the data are valid and reasonable, which we accomplish through customized validation rules to be specified with the Department.
- Two days before the snapshot dates we will contact districts that appear not to have submitted complete pre-ID data.
- The TIDE system provides real-time feedback to help the district user evaluate the accuracy of the data received, including frequencies, numbers of errors, and other configurable information.
- We propose to allow districts to amend their pre-ID information at any time.
- AIR will deliver the pre-ID snapshots to the Department, and the snapshots will include a pre-ID number for each student. That number will be unique to the student for the administration, and will not be repeated in other administrations.
- If the pre-ID information is not correct, school or district administrators will be able to change them in TIDE, and the information active in TIDE on a designated date will be merged with the score data prior to reporting, eliminating the need to grid school codes or other information on answer booklets.
- Test and answer documents will be sent to the school of record, or the alternative school if one is provided. If a pre-identified booklet is not available for a student, administrators will be able to correct the information and print out a new, scannable label from TIDE.

- Pre-ID rosters will be printed and will accompany the shipped test booklets and answer documents.
- Our real-time-ID and data cleanup processes will ensure that every student testing on paper has a labeled booklet, and that the data are accurate in TIDE.

7.5.3 Scanning/Editing Paper-Based Tests (PBTs) and Extracting Computer-Based Test (CBT) Records

AIR's automated data intake, processing, and extract systems are designed for high-volume efficiency and accuracy. Results for both CBTs and PBTs are naturally integrated by the system in real-time as test results are processed. Extract files that contain student data associated with each test event (administered online or on paper), test scores, and raw and scored student item responses, which include the exact responses entered by students, will be made available to the Department.

This section describes the scanning and editing procedures for PBTs, the data flows for both CBT and PBT results, and how PBT results are naturally integrated with CBT results. We also present our proposed approach for delivery of extracted CBT and PBT results.

DRC Processing and Scanning Statistics

- More than 13 million secure materials received and processed annually
- More than 250,000 materials processed daily
- 25 in-house IBML Image Trac scanners
- Weekly scanning capacity in excess of 19.3 million sheets

Scanning and Editing Paper-Based Tests

DRC believes that its combined experience and expertise in the areas of materials processing, image scanning, and performance assessment scoring are unsurpassed in the industry. DRC's 30-plus years of experience have resulted in a scannable document process that is extremely reliable and efficient for its state testing clients; DRC's processing and scanning processes are ISO 9001:2008 certified. The company takes pride in its ability to tailor processes to meet each of its clients' needs. DRC has successfully processed millions of scannable test materials for large-scale statewide assessments, including the following states: Alabama, Alaska, Louisiana, Nebraska, Ohio, Oklahoma, Pennsylvania, South Carolina, and Washington. All of the company's statewide assessment contracts utilize image scanning and scoring.

Processing and Scanning Resources and Capacity

One of the most experienced testing contractors in the nation, DRC scores and reports assessment results for more than 4.5 million students across the country. All processing and scanning occurs at fully secure facilities in Brooklyn Park, Minnesota, conveniently located within a few miles of DRC's corporate headquarters. DRC's materials processing and scanning facilities are custom-designed to support the company's high-volume operational capacity.

DRC's scanning capabilities include image scanning and scoring, barcode scanning, and optical character recognition scanning. The company's state-of-the-art, proprietary scanning system is highly configurable and fully scalable, which provides the flexibility needed to accommodate each of its state clients' needs.

Using a patented process, DRC's 25 in-house IBML ImageTrac scanners scan both single- or multiple-color documents. The image scanners used by DRC utilize high-quality color cameras capable of capturing images up to 300 dpi. Grayscale images are captured using 256-level grayscale (8 bit per pixel) format. Customized scanning programs selectively read documents and electronically format scanned information. All custom scanning programs go through quality review before testing materials arrive. DRC's image scanning operators have extensive experience performing tasks related to scanning and the maintenance of image scanning equipment. DRC's proposed operations lead staff has extensive direct experience with multiple statewide assessment programs. Please see Section 2 for complete profiles and résumés of DRC's scanning and scoring professionals, as well as DRC's Project Manager, Mr. Peter Tressel.

Providing the capacity for growth is a cornerstone of DRC's business model. The company is dedicated to funding the latest hardware and technology to ensure that it meets and exceeds its operational requirements. Its technical environment has grown substantially over the past few years and continues to expand. Constantly monitoring its usage throughout the technical environment, DRC routinely adds application servers, database servers, and other technical capabilities to stay ahead of the needs of its clients' programs.

DRC's scanning capabilities include image scanning and scoring, barcode scanning, and optical character recognition scanning. DRC's weekly capacity is more than 19.3 million sheets. DRC has evaluated the scanning capacity required for the Florida Standards Assessments (FSA) and is confident that its processing and scoring capacity is more than adequate to meet the needs of the FSA as well as the company's current contracts.

Verification of Return Procedures

DRC's state-of-the-art proprietary processing and scanning systems are highly configurable and fully scalable, which provides the flexibility needed to accommodate each of its state clients' needs. Quality-control (QC) processes are embedded into each phase to ensure accurate processing, scanning, and data capture.

DRC's materials management system, Ops MMS, enables 100% accuracy in processing and accounting for returned barcoded materials. Ops MMS uses barcode technology to track documents through all processing steps: box receipt, materials check-in and separation, and data validation. Please see Section 7.4.1 for more information on processing and accounting for returned student test materials and a discussion of documenting return errors.

An additional benefit of Ops MMS is that DRC's procedure for materials processing does not need or rely on header sheets to accurately account for all secure materials and track all data elements needed for reporting. AIR and DRC have a proposed an accurate and efficient alternative to using document count forms (DCFs), which will also save time for district personnel. Please see Section 7.4.7.5 for more information.

Document Scanning

DRC's proprietary imaging and hand-scoring systems maximize performance by accessing centralized data and images. Storing information centrally improves efficiency and eliminates unnecessary duplication and movement of data and images between servers and physical locations. Data and images used by both systems are stored on clustered SQL DB servers and centralized image file servers, which are housed in DRC's high-speed SAN disk storage.

Each IBML image scanner has two dedicated servers, one for image storage and one for data storage. Data and images from DRC's scanners are transferred to centralized locations via a high-speed network. Copies of the images are preserved for use during the image scoring process. Booklet counts and page integrity are maintained throughout the scanning process by storing data in a relational database management system (RDMS). A relational database significantly increases system flexibility and provides for robust data analysis capabilities. Scanning programs are customized for each assessment program and go through quality review before testing materials arrive.

During the scanning stage, constructed-response and extended-response items are captured as images and loaded into DRCs' Image Scoring System. The use of image scanning and scoring technology at DRC mitigates the inefficiencies of traditional paper-based packeting of constructed-response and extended-response items and student responses. DRC's hand-scoring system is based on a three-tiered architecture. Scoring applications access data and images via mid-tier applications running on Microsoft IIS servers. Images and data are accessed throughout the imaging and hand-scoring systems by proprietary patent pending software running on multiple servers and user desktops. The architecture of its proprietary system allows DRC to adjust server resources for processing efficiency and to minimize processing time. Please see Section 7.5.4.5 for additional detail on DRC's hand-scoring system.

A high-level overview of DRC's scannable materials process is shown in Exhibit 7.5.3.-1.

Image and Scan Quality Control

QC procedures are critical to DRC's document scanning process. All image scanning programs will go through quality review before testing materials arrive at the company's facilities. Throughout the scanning process, batches will be checked for quality and scanning accuracy by experienced document processing staff. Using a patented method, all DRC scanners are calibrated and cleaned regularly to ensure accurate and consistent scoring. DRC also has an on-site field service engineer to resolve any technical issues as they arise.

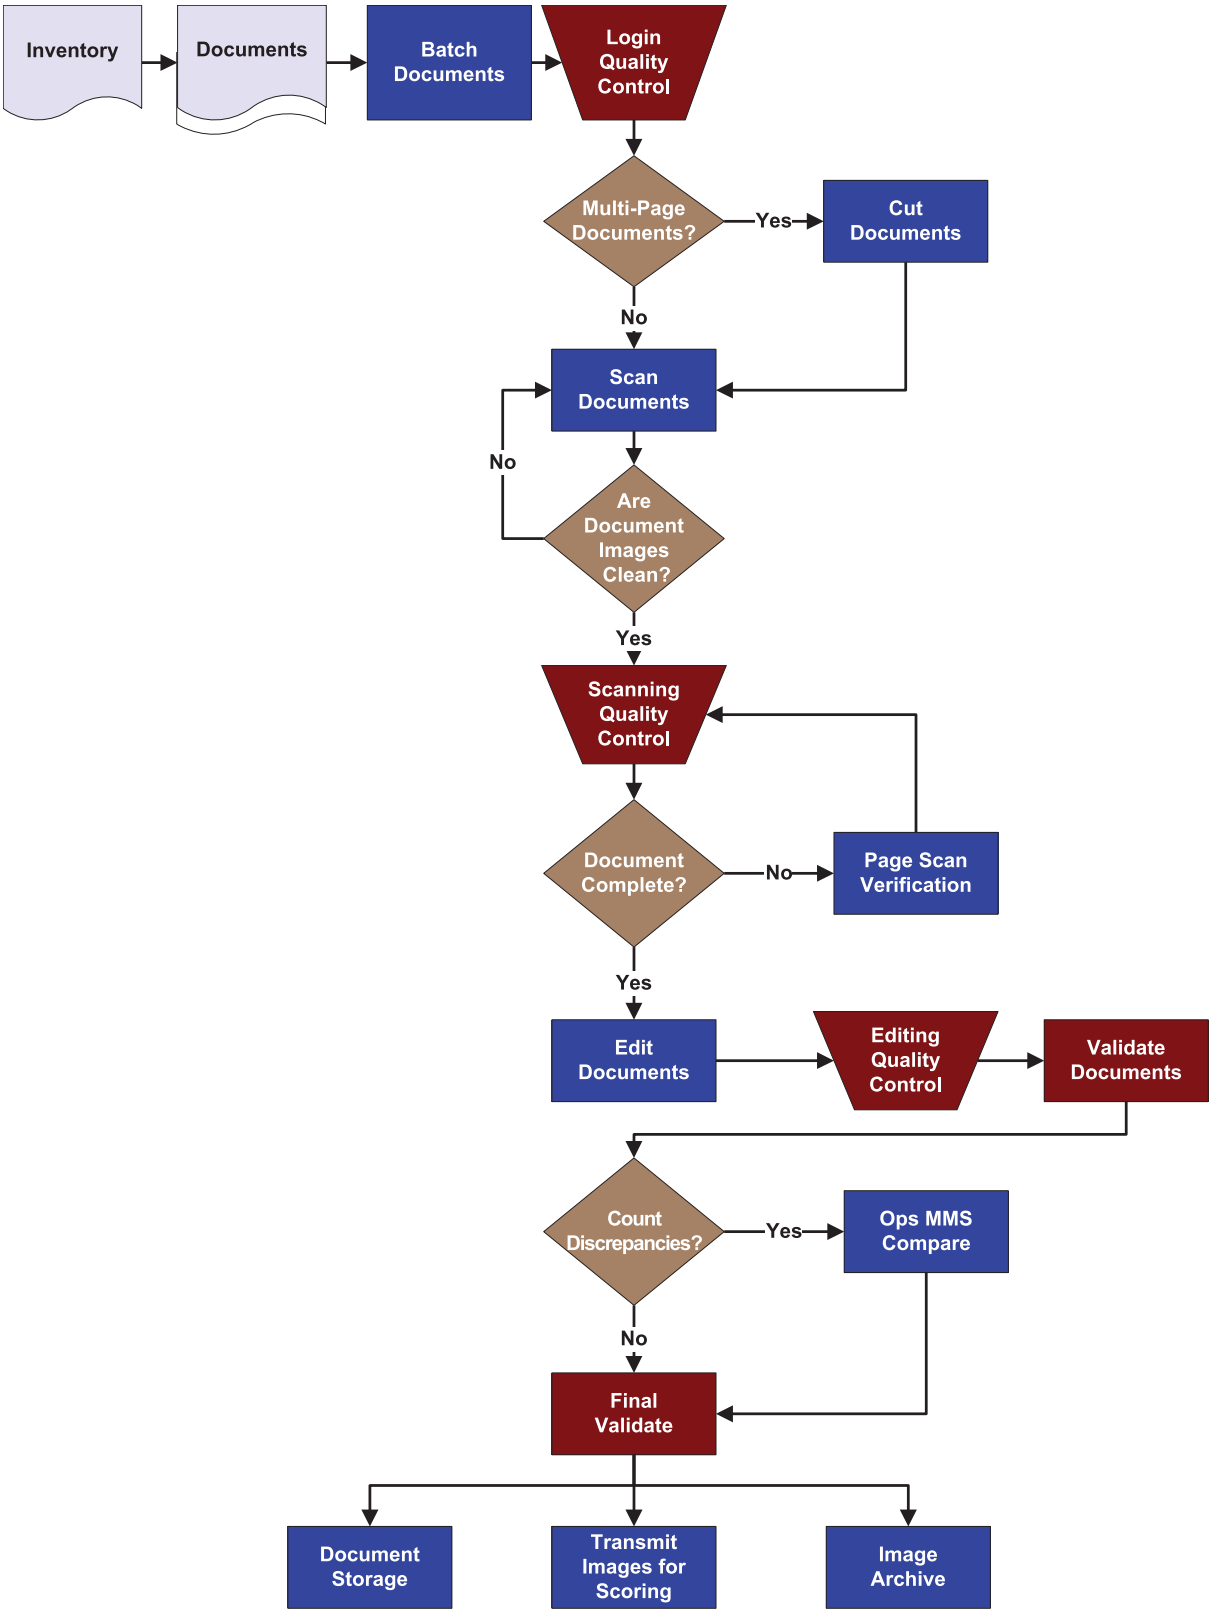
DRC's scanning process produces comprehensive, detailed information, including

- student demographic data;
- student multiple-choice response data;
- TIFF images of complete documents; and
- identifiers to link the TIFF images to the student demographic data.

DRC's QC procedures for document scanning include:

- Department-approved scope of work agreements (SOWA) will be established. All processing and scanning staff will adhere to the requirements contained in the SOWA.
- As scanning occurs, a unique serial number is printed on each sheet of paper. This serial number ties documents together and maintains sequencing within batches.
- The scanners pick up pre-defined processing criteria related to pre-printed barcodes, multiple-choice items, and student demographic and identification information. Constructed-response and extended-response item student responses are scanned; images are then separated out for image-based hand-scoring.
- As documents are scanned, the scanner is monitored to ensure that images meet DRC's strict quality standards.
- Regularly scheduled calibration and scanner cleaning processes will be conducted to

Exhibit: 7.5.3-1 DRC's Scannable Materials Processing



ensure image and read-level quality and consistency.

- All scanned images will pass through a software clean-up program and process. After image clean-up, a random sample of images is presented for image quality approval. If any image fails to meet DRC's quality standards, the entire batch of documents is rescanned.
- Page-scan verification is performed to ensure that all pre-defined portions of a document were correctly captured. A flatbed scanner is used to capture responses and images for any missing pages. These images are then added to the image data file and merged with the appropriate document.

Editing and Key Entry Processes

After scanning, the documents are processed through a computer-based editing program to detect potential errors in specified response fields. Marks or omissions that do not meet the pre-defined editing standards are flagged and routed to the document processing editing staff for resolution. For the FSA, AIR and DRC will work with the Department to develop edit rules specific to the FSA.

Using unique serial numbers printed on the documents during scanning, the editors compare the actual documents to online data. Corrections are then made to the data file according to pre-defined, program-specific guidelines. Double-key entry verification is conducted for all keyed items and any changes made to scanned values by staff personnel other than the initial keyer/editor. DRC will maintain a log that documents why scan file records were edited and by whom, as well as the name of the keyer(s) and editor(s).

DRC's editing staff follows strict QC procedures to produce clean data files that can be submitted for scoring and reporting functions. These procedures include the following:

- Edit specifications will be developed mutually by the Department and AIR and DRC.
- Experienced editors meticulously review any potential irregularities detected during scanning and make necessary corrections online to the image data file, referring to the actual document as required.
- Editors determine whether the marks are valid (based on assessment requirements) or non-correctable.
- All items flagged during document scanning are presented to editing staff for first-time entry.
- Any changes made to scanned values and all items entered the first time are double-keyed for verification by editing quality staff.
- Once verification by editing quality staff is completed, a QC report is generated for review during post-editing.
- After all corrections for a batch have been entered and verified, the correction file is stored in a relational database for reference.

Post-Editing Processes

A final edit is performed to confirm that all requirements for final processing have been met. Once the demographic information and multiple-choice data pass all the pre-defined editing processes, the images of the student responses to constructed-response and extended-response items are extracted into files for scoring. These student response images will be routed through the DRC Imaging Workflow System to hand-scoring terminals at DRC's Scoring Center for scoring by qualified readers. Please see Section 7.5.4.5 for a thorough discussion of DRC's highly regarded hand-scor-

ing process. Images are stored so that they can be efficiently retrieved on the basis of student and school identification information, scores, and item information. Upon completion of processing, scannable documents are boxed for security purposes and final storage. Please see Section 7.4.3 for more information on DRC's storage procedures.

DRC's post-editing QC procedures include the following:

- During this processing step, the actual number of documents scanned will be compared to the number of scannable documents assigned to the box during materials receipt. Any count discrepancies between materials receipt and documents scanned will be resolved at this time.
- Suspect student precodes, district and school numbers, and documents IDs are reviewed for additional verification.
- All editing QC reports are reviewed to ensure all changes were processed accurately.
- All corrections during post-editing are made electronically and a new validation report is generated to confirm the changes have been processed accurately and the report is clean.
- After all final processing requirements have been met, the batch is released for constructed-response/extended-response scoring and student-level processing.

Scan Files

Before creating scored files, AIR and DRC will provide the Department with two versions of the scan files—original scan files and edited scan files. We understand that the original scan files will contain student response information exactly as scanned, while the edited scan files will contain the final scanning files that include all edits made during scanning to ensure that students receive the correct report during the initial reporting wave. AIR and DRC will work with the Department to develop edit rules specific to the FSA. If incorrect edits are discovered during data verification, AIR and DRC will update the edit files. DRC will ensure that all scanning and data file development and delivery is accurate and timely, adhering to all timelines necessary for psychometric tasks and activities to facilitate the on-time delivery of results reporting.

All original and edited scan files will adhere to the Department's specifications pertaining to format and layout, including fields, values, and content. Any Department-requested changes will be documented and incorporated. DRC will utilize stringent quality assurance procedures for the development of all scan files. DRC's technical and QC production procedures are industry-leading.

DRC's software quality assurance staff will ensure the quality of the original and edited scan files and will make certain that each record is verified for completeness and accuracy. DRC is prepared and accustomed to handling complex programs with multiple forms, grades, and subjects. The company has solid, built-in checkpoints and reviews throughout the entire processing, scanning, editing/post-editing, scoring, and data file development processes. Software quality assurance experts will conduct extensive quality checks on all system data. QC checks will be performed throughout the system-level testing to ensure the integrity of the data.

Below is an overview of the processes and methods that DRC will use to ensure the accuracy and completeness of student data and associated data files:

- All student answer documents returned to DRC will be scored. Multiple-choice items

and demographic information will be image scanned and the original scanned data will be converted into a master student file. Constructed-response and extended-response items will also be image scanned and sent electronically to DRC Scoring Centers for scoring by trained, qualified readers. All student information and score results are kept secure and confidential throughout the scanning, scoring, and reporting processes.

- Record counts will be verified against the counts from the document processing staff to ensure all students are accounted for in the file. Additionally, a detailed review of the error-tracking log will be performed to ensure any discrepancies are resolved before proceeding with the scoring routines.
- The scoring process will include the scoring of multiple-choice items to the answer key and the aggregation of raw scores from the open-ended responses. Quality assurance staff will compare the processing file against the answer key source file to ensure accuracy. Using final, approved answer keys, edited batches will be processed through scoring and reporting programs. Items will be scored as right, wrong, omitted, or double-gridded. After scanning and scoring, DRC quality assurance staff will verify values for multiple-choice and open-ended items.

Computer-Based Test Extracts

Each time a student completes a CBT, the test delivery system transmits data from that test event to our Quality Monitor (QM) system. Transmitted data includes

- student, school, and district identifiers;
- raw and scored student item responses;
- accommodation records; and
- initial scores (those reported to the student).

Upon receipt of the student record, the QM system

- verifies scoring of student responses;
- validates scores presented to the student;
- calculates any other scores that will be used in the reporting systems along with standard errors of measurement (SEM);
- calculates derivative measures from those scores (e.g., proficiency designations); and
- performs customized validations of incoming data.

In virtually all cases, these checks are all passed. When they are not, an automated system alerts project team members, who investigate and resolve the issue.

QM's quality checks are typically completed within a second of receipt of the data. Once complete, the data are transmitted to the Database of Record (DoR) and the online reporting system.

QM's quality reporting interface accesses DoR to provide reports on a variety of ongoing quality monitoring issues. These statistical reports include monitoring of item exposure, item drift, and match to blueprint. With the exception of item drift (which simulations cannot predict), the content of these reports is well predicted by the simulations that we conduct prior to deployment, so surprises are rare.

Data from the system can be extracted and delivered through an automated system, our Data Extract Generator (DEG), with whatever frequency the Department desires, up to once per day. We will work with the Department to establish

- a customized data delivery format;

- a set of data validation rules for the files sent to the Department; and
- a mutually agreed-upon transfer protocol (we typically use a secure file transfer protocol (SFTP) to monitored directories).

These data delivery files are automatically validated against the format, using the established business rules prior to delivery. States receiving nightly updates typically retrieve the data files from the SFTP server programmatically and automatically update the state data warehouse or other data store. The data can be delivered with whatever frequency the department desires, up to nightly.

If the Department chooses, state personnel as well as educators throughout the state can have immediate access to the data through the online reporting system. That system is described in detail in Section 7.5.5.

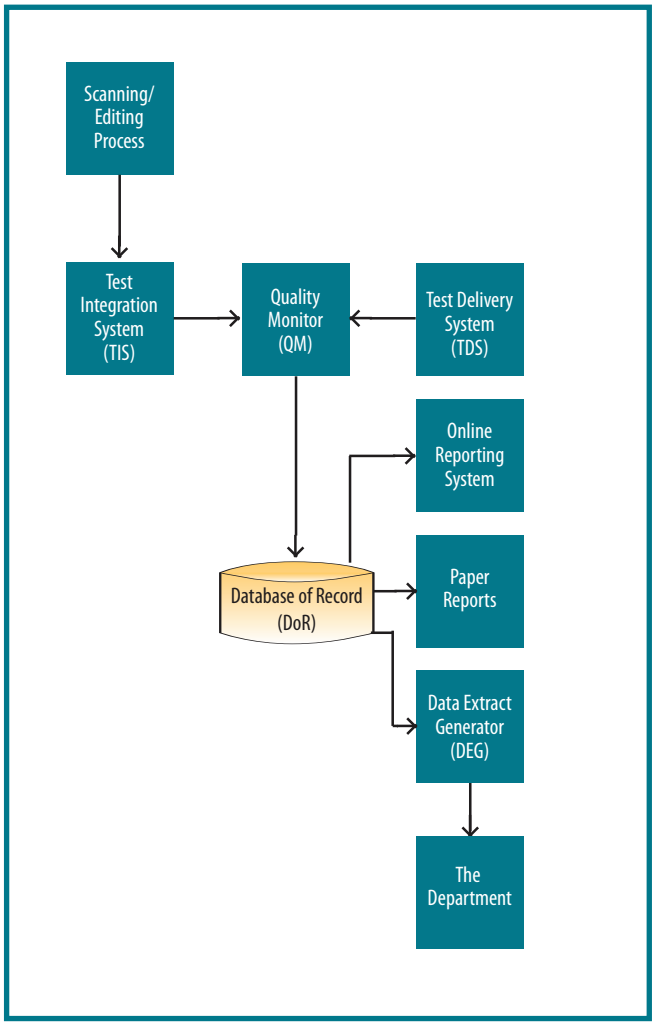
Integration of Paper-Based Test Results with Computer-Based Test Results

AIR's system naturally integrates results from the PBTs and CBTs. Scanned and edited results from PBTs pass through the Test Integration System (TIS), which applies a data intake process to reconcile data that may be inconsistent under a paper program. For example, unknown or missing student identifiers often must be resolved. Please see Section 7.5.5.1 for more information about resolving discrepancies.

TIS translates the scanned and edited data to a common format, which is shared by all other systems that interact with or store the data, including the QM system, DoR, and online reporting system. The data is then sent to the QM system, where it is processed in the same way that the CBT results are processed.

Exhibit 7.5.3-2 shows the data flow for this process. The two data streams meet in the automated QM system, which checks results, gathers statistical data on item and test performance, stores the data in the DoR, and delivers the data to the online reporting system.

Exhibit 7.5.3-2: Data Flow Process of Integration of CBT and PBT Results



Integrated Data Extracts

AIR recommends extracting and delivering paper-based testing data, including both scanned and edited data elements, along with computer-based testing data in a single, com-

mon layout but can also create different layouts for each type of data, depending on the Department's needs. A common layout could be used for the purpose of transmitting participation data without test scores as well as for the SSR files containing test scores, and derivatives thereof, discussed in Section 7.5.4. As described previously, AIR will work with the Department during the specifications process to fully define the customized data delivery procedure to transmit all data in the format and on the timeline that the Department desires.

7.5.4 Scoring

Accurate scoring and reporting of assessment results require a robust data management system with built-in quality assurance (QA) processes as well rigorous external review. Data files containing background information about students and users must be collected, maintained, and updated over time. Student assessment results, including raw and scored item responses, as well as ancillary data, such response latency for online assessments or mark densities for paper assessments, must be collected, scored, verified, and merged with background information to report assessment results. Previous-year assessment results must also be maintained to support longitudinal reporting of student performance over time.

Each year of the contract, AIR will provide the range of score files required by the Department. To accomplish this, at the beginning of the contract period, AIR will provide the Department draft data file layouts for each required file for review. AIR will work with the Department to make any revisions to the data file layouts necessary to meet data analysis and score reporting requirements. Upon Department approval of the data file layout, the statistical programming necessary to automate production of data files will begin, including QA procedures designed to verify accurate production of all data files. AIR will annually review the data file layouts with the Department, identify any desired revisions, and modify code as necessary to implement revisions, including application of QA procedures to verify that data files and data file layouts are correct.

Florida has the option of making early data available. Currently in Florida, local users can access downloadable data files only after all of the scanned data and hand-scored files are analyzed, prepared, and posted for district download.

With AIR's online reporting system (ORS), the Retrieve Student Results tool allows users to export a raw data file for district, school, teacher, or roster as the data become available. For example, as a class or school completes the Florida Standards Assessment (FSA) tests, these data can be available in the ORS immediately and users can request a data file for that class, school, or district, at the Department's discretion. In addition, these data files can be configured to include students' identifying information, student demographic information, test participation status, and performance information at the subject and subscore levels. The files can be exported into Microsoft Excel or any other delimited file format so that they can be easily loaded into other software platforms. The reporting tool will store the file for a set period of time so that the user can access it later. Tests administered on paper, or requiring hand scoring, will appear in the ORS once imaged data passes through the Quality Monitor (QM) system and hand scores are integrated via the Test Integration System (TIS). Although our plan is to provide downloadable data files through the ORS, should the Department prefer, AIR is also prepared to provide the state and districts with data files outside of the ORS, which can be securely downloaded.

As we describe in Section 7.5.5 on Reporting, in addition to the raw data files in the Retrieve Student Results tool, users can export any table on any report in the reporting system. An Export button is available on every report, and the user can immediately export the table as an Excel file.

It is important to emphasize, however, that immediate reporting is not a requirement of the ORS, and the Department may very well choose to delay reporting of assessment results for a variety of reasons, including, among others, verification of machine-scored constructed-response items, completion of hand-scoring activities, application of post-equating activities, or revisions to the student demographics file. Whether the Department chooses to provide for immediate reporting of test scores or to delay reporting until critical activities have been accomplished, the processes used to verify score reports and data files is the same, as described in detail below.

Flow of data

The Roster Tracking System (RTS) tracks student enrollment and demographic variables, relationships among districts, schools, teachers, classes, and students, as well as user rights. Florida districts can either upload enrollment data directly or TIDE can accept nightly updates from the Department's own enrollment tracking system.

The Department's history files, including alternate passing score eligibility, verification of testing status, and all previous test scores are also included as part of the RTS. Student information flows from RTS to the test delivery system (TDS). Information in the RTS is used to establish student eligibility for test administrations. Students may only access tests for which they are eligible. In addition, special scoring rules, including alternate passing scores, are communicated to TDS to guide test administration and scoring.

District, school, teacher, class, and student information also flows from RTS to ORS to support production of

- score reports; and
- district, school, teacher, and class data files

Raw and scored item responses and other data collected by the TDS flow to the QM system, which conduct a series of checks, including item and test rescore, and then passes scored items to the Database of Record (DoR) for storage. The QM system also provides checks on item functioning and testing irregularities that psychometricians can evaluate on demand. Student raw and scored item responses imaged from paper answer documents are also routed through the QM system before they are passed to the DoR so that the same QA checks on item and test scoring are also applied to paper-based assessments.

Items requiring hand scoring are routed from the TDS to the hand-scoring system. Upon completion of hand scoring, scored item responses are uploaded to the TIS where hand-scored item responses are attached to the students test record. The TIS merges all the machine-scored and hand-scored items from a single test opportunity into a single XML file for routing to the DoR.

The DoR is AIR's canonical source for all test data. Outcomes of any item or test score appeals, test score verifications, item rescores, invalidations, or any other post-administration adjustments are reflected in the DoR. Thus, all test data used to produce data file deliverables and populate the ORS flow from the DoR.

The Data Extract Generator (DEG) is used to produce analysis files for classical and IRT analyses. AIR will work with the Department

Exhibit 7.5.4-1: Systems Summary

System	Description
Quality Monitor (QM)	The QM system receives tests as students complete them, conducts a series of quality checks, stores scored items in the DoR, and routes items requiring hand scoring to the hand-scoring system. The QM system also conducts a variety of additional quality and cheating detection checks.
Test Integrated System (TIS)	The TIS is responsible for the "automated virtual stitching" of the test where there are hand-scored responses. Since hand-scored items go through a different process than machine-scored items, TIS takes the machine-scored items of a test opportunity and integrates them with the hand-scored items of the same test in an XML file. This file will then be uploaded into the DoR and sent to the ORS.
Database of Record (DoR)	The DoR maintains the authoritative records of tests administered and completed. This includes all hand-scored responses of the test. Data in the DoR reflect appeals, verifications, and other post-administration adjustments to the data.
Data Extract Generator (DEG)	The DEG is responsible for pushing all assessment data into the Department's site on a predetermined schedule.
Online Reporting System (ORS)	The ORS provides a secure interface to assessment data and associated demographic information. It provides educators with a powerful tool to explore the data and turn them into actionable information.

and their QA contractor to identify the structure of the files transmitted for all statistical analyses, including calibration and equating, item and test score verifications, classical item and differential item functioning (DIF) analyses for field-test items, and mode comparability analyses. Once final specifications have been approved by the Department, the DEG will be configured to generate the data file in the agreed-upon layout, with QA procedures in place to ensure that the extracted data is accurate and that the file conforms to the agreed-upon structure. AIR will apply the same structure to all simulated data file deliveries as well. Exhibit 7.5.4-1 provides a systems summary for the flow of data.

7.5.4.1 Types of Scored Files

AIR is committed to providing the Department with all FSA assessment results accurately, on time, and in the format necessary to meet the Department's needs. As noted above, data file deliverables used for analysis by the Department and its QA assurance contractor are generated directly from the DoR. Data files provided for educator download, including roster reports, and aggregated classroom, teacher, school, and district reports are designed to be generated through the ORS. Each user's role will determine which reports can be generated in accordance with Department-specified requirements. As described in Section 7.5.5, all rosters and reports generated in the ORS can be exported to user-friendly file formats such as Excel or other file types. Should the Department also require the data files be available for download through a different secure site, AIR will provide these files as separate deliverables.

State Student Results (SSR). This file includes item responses, test scores, and student enrollment and demographic information for all students participating in the FSAs. This file is used for all calibration, equating, and scaling activities, classical and DIF analyses of field-test items, item and test rescore verification, mode comparability analyses, and other psychometric analyses. Data file elements and structure will be developed by AIR for Department review and approval. Once data

file specifications are finalized, they will be programmed into the DEG and extracts will be verified for accuracy. DEGs can be generated on demand, on a scheduled basis, or both, should the Department wish to receive regular updates from the DoR in addition to milestone deliverables.

State Aggregated Results (SAR) and District Aggregated Results (DAR) files. Test data from the DoR and student enrollment and demographic information, and user information from the RTS, can be routed to the ORS to support immediate reporting of assessment results. Following the Department's aggregation rules, student results are aggregated to generate classroom, teacher, school, district, and state level results. The user's role applies the Department's rules on what reports users are able to generate. At the Department's discretion, online rosters and reports can be exported to user-friendly file formats such as Excel. Educators can generate reports and data files immediately upon completion of test administrations that are entirely machine-scored. Test administrations requiring hand scoring are not available in the ORS until after results of hand scoring have been uploaded to the TIS, attached to the opportunity record containing machine-scored items, and deposited as a single record in the DoR, at which point they can be released to the ORS for immediate reporting.

Close-out SAR and DAR. At any point, the ORS aggregate and roster reports are up to date. Test records that are embargoed can be released at any point and upon release will be automatically included in district and state aggregated results. Similarly, any answer documents submitted late and processed as a late batch are available to the ORS for reporting and data file production once hand-scored items have been uploaded to the TIS and stitched to the machine-scored test record, with the unified test record returned to the DoR.

Concatenated SAR and DAR files across test administrations each year. Assessments with retakes can be configured as multiple-opportunity assessments, with eligibility for each opportunity contingent upon performance in previous test opportunities. In this way, the ORS can automatically include all testing opportunities administered in an assessment cycle.

Demographic results based on Survey 3 membership file. All aggregate reports in the reporting system can also be disaggregated by subgroups defined by the Department. For example, reports can be disaggregated by demographic characteristics, such as gender, ethnicity, or English language learner (ELL) status. The reporting system can also be configured to disaggregate by multiple characteristics at once (e.g., gender by ethnicity).

In addition to the expected aggregated reports for a district, school, teacher, and class, the reporting tool allows users to create custom rosters of students so that they can be tracked and reported on separately. Teachers may, for example, create their own disaggregate groups to track students who are receiving additional assistance or participating in a special program. By creating new subgroups, teachers can generate additional rosters and reports to monitor the progress of those students independently of classroom at large. The ability to define special subgroups of interest may help teachers to address questions about the effectiveness of the extra help or participation in special programs. All aggregated reports are calculated from the student level up, so as new students test, reports for the roster, teacher, school, and district are updated instantaneously.

Create CDs/DVDs for districts upon request. Although districts can export data files directly from the ORS, AIR will also deliver data files to districts on CDs/DVDs or make data files

available for district download via a secure file transfer protocol (SFTP) site.

7.5.4.2 Types of History Files

The Department anticipates that three types of history files will need to be maintained by the contractor to support implementation of special scoring rules and reporting requirements. The three history files include:

- *Alternate Passing Score File.* Because some students may participate in the grade 10 English Language Arts/Literacy (ELA/L) prior to the Department's adoption of performance standards, these students may be grandfathered into a lower passing score requirement. This file will include all students eligible for the alternate passing score and will be updated to reflect subsequent test administrations for each student.
- *Testing Status.* For the Algebra 1, Geometry, and Algebra 2 End-of-Course (EOC) assessments, the Department requires verification of each student's test status (e.g., first-time tester verses retaker).
- *ELA/L and Mathematics History File.* To track student performance across test administrations, beginning with the first test administration, the history of each student's test performance, including test scores and performance levels, will be maintained by the contractor, updated following each test administration, and provided to the Department at the end of the contract period.

AIR will work with the Department to identify the format of the history files and develop rules for merging records in the history files with student test records, all of which will be submitted to the Department as part of the scoring and reporting specifications. Should the Department desire, upon close of test scoring and reporting activities each year, AIR will provide the Department with updated history files for use by the Department and QA contractor to verify subsequent year score reports.

7.5.4.3 Types of Scores and Codes on the SSR/DSRs

As described in Section 7.3.7, test forms are constructed using the FormBuilder utility in the Item Tracking System (ITS). This is true of all forms, whether online or paper, fixed form or adaptive. In the case of adaptive assessments, the form defines the adaptive item pool for the administration, which may be a subset of items available in the operational pool. Once a test form is defined, FormBuilder generates a series of automated documents that are critical to test development, scoring, and reporting, including test maps, key files, and conversion tables. The automated production of these documents reduces the likelihood that errors will be introduced into the production of these critical documents.

The format of test maps is configurable and designed to meet the Department's needs. Our systems directly read the test maps, so some of the fields are mandatory to support our internal workflow, but we can add fields as necessary to support Department workflows.

Because production of test maps, key files, and conversion tables is automated, forms can readily be revised in FormBuilder (e.g., dropping an item), and new test maps, key files, and conversion tables generate automatically. The virtue of the automated system is especially apparent when revisions are being made while working under tight timelines.

Consistent with the Department's traditional practice, we propose using the maximum likelihood estimator (MLE) pattern scoring rather than conversion tables to score tests. Pattern scoring yields more accurate test scores than number correct scoring, because it utilizes the

item discrimination and guessing parameters to evaluate student responses to each item. In addition, dropping items for any reason becomes less error prone and faster, because new conversion tables do not need to be generated, verified, and loaded into the scoring system. Rather, we can simply toggle the item role switch in the configuration file and regenerate test scores.

Each year AIR will deliver to the Department a scoring and reporting specifications document. Scoring specifications will include procedures for estimating student ability, the linear transformations necessary to place ability estimates on both the within-grade and developmental reporting scales, as well as the performance level classifications based on the cut scores adopted by the Department. Specifications for classifying subscale performance, as well as strength and weakness reports for strand and benchmarks, will also be included where appropriate.

We note that the Department anticipates that ELA/L Retakes may have multiple sets of passing scores based on date of initial assessment. The RTS maintains each student's entire assessment history, so that test administrations can readily be configured to apply scoring rules based on the date of the student's initial test administration.

The RTS maintains all the student and user information necessary to report assessment results, including the school type variable that indicates which schools are included in district and state aggregate reports and data files (e.g., homeschooled students are not included in aggregated reports).

In addition, some test records are not scored based on characteristics of the test administration, including, for example, rules governing whether a test administration was attempted, invalidations based on cheating, or other irregularities in the test administration. These rules are also documented in the scoring and reporting specifications and will be configured into the QM.

The Department also notes that some codes are derived from multiple variables. Derived codes are easily handled by the ORS and will also be documented in the scoring and reporting specifications for Departmental approval prior to being programmed into the reporting system.

AIR will work with the Department to identify all codes to be provided in score report and data files prior to each test administration cycle. Rules for computing and applying codes in the reporting of test results will be documented each year in the scoring and reporting specifications document. AIR will verify the accuracy of the code computation and application in score reporting and data file generation.

7.5.4.4 Handling Special Print Documents

Processing of Accommodated Materials

AIR team member DRC will provide a clear, well-documented return process for all special print test materials (Braille, large print, and one-item-per-page (OIPP) versions), increasing the accuracy and decreasing the turnaround time of special materials return shipments. Unlike many testing companies, DRC does not require special packaging or return procedures for special print test materials, requiring little document preparation and saving time for local test administrators involved in materials return. DRC's automated, barcode-based materials management system—the Operations Materials Management System (Ops MMS)—allows for fast and accurate data collection with no dependence on materials/document order. DRC will also provide the excellent sup-

port of its highly regarded customer service staff to assist test administrators with any questions regarding preparing and packaging materials for collection and shipment back to DRC.

DRC will maintain all quality and security procedures that will have been used during processing and scoring of the regular print paper-based test (PBT) materials and student response documents. DRC will use its standard operating procedures for checking in and accounting for all secure materials once they arrive at DRC (please see Section 7.4.1 for more information). DRC will ensure that all special print processing adheres to Department requirements. Captured data are organized into user-friendly reports from the start of the secure materials check-in process, providing valuable insight into suspected material shortfalls as early as possible and mitigating potential consequences of delay. During materials receipt, DRC will document in the error log any errors in packaging or returning test materials made by schools and districts. DRC will correct any materials preparation issues so that processing and scoring can proceed. However, DRC will also contact districts and the Department to resolve any issues that require additional resolution.

AIR and DRC understand that scores for students using special print materials will be included in the initial report releases. DRC's proven streamlined methods for receiving and processing special print materials will ensure that there will be no delay in scoring and reporting of these materials.

Braille Transcription

After receipt and processing of Braille response documents received from districts, DRC will batch these materials for expedited handling and transcription. DRC will work with staff from the American Printing House for the Blind (APH), the same vendor providing Braille format test materials, to conduct transcription of Braille answer documents into corresponding, scannable regular print documents. APH is a nationally recognized Braille publishing house and experienced provider of Braille assessment services. DRC and APH will ensure that all transcribed responses are proofed and double checked by a qualified professional other than the initial transcriber.

Transcribed documents will be linked to individual students and their original Braille-response documents using unique document ID numbers and student PreID labels. After receiving the transcribed materials from APH, DRC will process, scan, and score these documents using the same processing and scoring routines it uses for regular print PBT student response documents. All standard quality and security procedures will be maintained. After transcription and processing, both the original Braille and transcribed response documents will be securely stored for easy retrieval if required.

Large Print and One-Item-Per-Page Transcription

DRC has the full, in-house capability to provide large print and OIPP transcription services for the Florida Standards Assessments (FSA). DRC offers transcription and key entry services as alternative processing and response capture options. With its team of skilled individuals, DRC has the capacity to handle complex transcription and key entry of more than 500,000 complex items during a four-week processing period, with the ability to increase capacity as needed.

Customized transcription and key entry relies heavily on DRC's highly skilled data entry professionals, extensive training and specification review, internal data validation inputs, and constant quality control checks throughout a project. Using the expertise of its data entry

team, DRC will ensure that all transcription is conducted accurately, efficiently, and within the processing, scoring, and reporting timelines required for the FSA. All fields will be keyed twice by two trained personnel and verified prior to final data validation.

After receipt and processing of large print and OIPP response documents received from districts, DRC will batch these materials for expedited handling and transcription. DRC's data keyers will transcribe large print and OIPP student responses into corresponding, scannable regular print documents. Transcribed documents will be linked to individual students and their original large print or OIPP response documents using unique document ID numbers and student PreID labels. After transcription, DRC will process, scan, and score these documents using the same processing and scoring routines it uses for regular print PBT student response documents. All standard quality and security procedures will be maintained. DRC will ensure that all transcribed responses are proofed and double checked by a qualified professional other than the initial transcriber. All transcription will adhere to Department specifications.

If preferred, AIR and DRC large print and OIPP student responses can be transcribed directly into AIR's computer-based assessment (CBA) system. Upon award, if desired, AIR and DRC will work with the Department to define specifications for a computer-based test (CBT) transcription method.

Special Document Tracking Log

DRC has a great deal of experience meeting the unique reporting needs of its clients. DRC routinely provides customized tracking logs and reports for its clients. For the FSA, DRC will develop a special document tracking log for inventorying and tracking special print documents from receipt and initial processing through transcription and final processing. This system will be tailored to meet the specific needs of the FSA; AIR and DRC will work with the Department to define specifications and format as well as submission frequency to the Department.

7.5.4.5 Handscoring

AIR team member DRC brings a tremendous amount of experience scoring constructed responses for many large-scale assessments. AIR has total confidence in DRC's ability to provide superior service to the Florida Standards Assessments. DRC has an established, successful history of scoring online responses for AIR for several other assessment programs, including those for Minnesota and Ohio.

DRC's handscoring processes are ISO 9001:2008 certified. The company has 27 years of experience in providing accurate scores for millions of student responses from large-scale assessments for numerous clients, including Alabama, Alaska, Arkansas, Florida, Kentucky, Louisiana, Minnesota, Nebraska, New Jersey, North Carolina, Ohio, Oklahoma, Pennsylvania, the Smarter Balanced Assessment Consortium, South Carolina, and Washington. DRC has utilized numerous scoring models to score responses from multiple content areas, grades, and end-of-course assessments, and it has significant experience scoring assessments with a mix of online responses and pencil-and-paper responses for clients.

AIR and DRC understand that there will be handscoring for each of the four assessment components outlined in the ITN. These include the computer-based and paper-based assessments for

- English Language Arts/Literacy in Grades 3–8;
- Mathematics in Grades 3–8;

- English Language Arts/Literacy in Grades 9–11; and
- End-of-Course assessments in Algebra 1, Geometry, and Algebra 2.

DRC understands that the ELA/L grades 3–11 assessments will include five operational short constructed responses per student and one long and one short passage-based essay per student. DRC further understands that the assessments for Mathematics grades 3–8 and EOC assessments for Algebra 1, Geometry, and Algebra 2 will include five operational short constructed responses per student. For online versions of these assessments, DRC acknowledges that a subset of these items and responses will require human scoring. For paper-based assessments, DRC will handscore all of these student responses.

Because of the high stakes associated with the Reading portion of the Grade 3 ELA/L the entire grade 10 ELA/L assessments, AIR has devoted extra handscoring resources to these tests. Specifically, these assessments will be double human scored when delivered on paper, and the responses to the grade 10 Writing prompts delivered online will be both machine and human scored, with 100% human resolution of any difference between the scores. For the high-stakes Algebra I assessment, all constructed responses on paper tests will be double human scored, with resolution of nonadjacent scores. For responses writing prompts in all other grades, 25% of the machine-scored responses will be routed to human scorers based on algorithms identifying potentially anomalous responses. For all other portions of the assessment, 20% of the responses will receive a second reading for the purpose of monitoring and maintaining sufficient inter-rater reliability. AIR and DRC will work with the Department to establish a specific set of scoring rules for resolving disagreement between first and second readings by utilizing subsequent independent readings performed by team leaders and scoring directors.

DRC has strong performance assessment expertise in all facets of English Language Arts stemming from extensive handscoring of ELA constructed responses for many client states, including Alaska, Louisiana, Kentucky, Ohio, Minnesota, Pennsylvania, South Carolina, and Washington. It has significant experience with scoring passage-based essay items for Louisiana, Pennsylvania, and the Smarter Balanced Assessment Consortium. DRC also has substantial experience with scoring Mathematics constructed responses for many client states, including Alaska, Kentucky, Louisiana, Pennsylvania, and Washington. Most of these programs included two- and four-point items. For both ELA and Mathematics, DRC has scored responses for students ranging from early elementary to high school.

DRC's Performance Assessment Services knows that the proposed work will require careful planning, thorough and thoughtful systems designs, and sound execution of agreed-upon procedures. DRC's content staff has many years of experience with large-scale assessments, and its management staff has an in-depth knowledge of monitoring scoring sessions, producing accurate results, and meeting deadlines for various clients. AIR is confident that DRC's experienced staff will successfully complete all handscoring associated with the Florida Standards Assessment and that the State of Florida Department of Education (the Department) will be pleased with the results.

Staffing

DRC offers experienced performance assessment personnel who are unsurpassed in the industry. DRC scorers, team leaders, and scoring directors are dependable, accurate, and instrumental in meeting strict reporting deadlines. DRC's handscoring personnel have expertise in scoring many large-scale assessments that have incorporated numerous content areas, scoring models, and procedures.

DRC understands that any scoring director/assistant scoring director and any content specialist who is assigned to the Florida Standards Assessment must have an appropriate educational background as well as prior, equivalent scoring experience.

DRC is pleased to propose highly qualified leaders in the handscoring field, with significant experience working with large-scale ELA and Mathematics assessments. The DRC handscoring team consists of managers and content specialists who have overseen handscoring for many large-scale ELA and Mathematics assessments. Please see Section 2 for complete profiles and résumés of DRC's handscoring professionals in Appendix A.

Handscoring Advisor: Ms. Sherri Woolf, Vice President of Performance Assessment Services, will ensure that scoring services for Florida are of the highest quality. Ms. Woolf is based out of DRC's Sharonville, Ohio, scoring center. She brings over 21 years of large-scale testing experience to DRC's Performance Assessment Team. Ms. Woolf currently leads scoring operations for DRC, overseeing more than 3,000 professional scorers and seven scoring centers. Over the course of her career, she has also worked as a grade 7 and 8 Writing teacher and as a consultant for a state department's scoring center. Ms. Woolf holds an M.S. in Human Resource Development from Xavier University in Cincinnati, Ohio and a B.S in Elementary Education from Miami University in Oxford, Ohio.

Handscoring Senior Manager: Ms. Wendy Marik will oversee and coordinate DRC's Performance Assessment Services to ensure accurate and timely handscoring for the state of Florida. Ms. Marik has served in this capacity for the Washington Comprehensive Assessment Program since 2009. Since 2006, she has also acted as the Content Specialist for the Writing and ELA components of the Pennsylvania System of School Assessment. Ms. Marik also played an instrumental role in DRC's Performance Assessment Services ISO 9001:2008 certification. Prior to joining DRC, Ms. Marik was a kindergarten classroom teacher, a K–12 computer technology teacher, and an ELA and Mathematics tutor. She holds a M.Ed. from Xavier University in Ohio as well as a B.A. in Computer Science from DePauw University in Indiana.

ELA/Literacy Lead Scoring Director: Ms. Pamela Ahrens has 10 years of experience working on large-scale ELA assessment projects. Since 2008, Ms. Ahrens has worked closely with the Pennsylvania Department of Education and educators to develop training materials for the Pennsylvania System of School Assessment and Keystones exams. She has similar ELA content experience with the Smarter Balanced Assessment Consortium, South Carolina, and Washington. Her responsibilities during this time have included monitoring handscoring projects, supervising handscoring staff, and coordinating rangefinding activities. Ms. Ahrens has experience with numerous Writing and Reading assessment models and rubrics, including the passage-based essay item type. During her time at DRC, she has served in many handscoring roles and has applied her expertise in both Reading and Writing to many large-scale assessments, including Alaska, Arkansas, Louisiana, Minnesota, Ohio, Oklahoma, Pennsylvania, Smarter Balanced Assessment Consortium, South Carolina, and Washington. Complementing her performance assessment background, Ms. Ahrens has teaching experience in both ELA and Spanish in a public school setting at the middle and high school levels. She has also managed libraries at two medical facilities in Minnesota. Ms. Ahrens has a B.S. in Education for English and Spanish, and an M.A. in Library Science.

Mathematics Lead Scoring Director: Mr. Coskun Baysoy has 10 years of experience working on large-scale Mathematics assess-

ment projects. In his current role as Mathematics Content Specialist, he manages all aspects of handscoring operations for the Washington Comprehensive Assessment Program end-of-course Mathematics exams. His responsibilities also include monitoring handscoring projects, supervising handscoring staff, and coordinating rangefinding activities. Mr. Baysoy has experience overseeing automated and computer-aided scoring for a variety of programs and item types. He also played an integral role in Mathematics item writing/development for several programs, including the Smarter Balanced Assessment Consortium and Pennsylvania Keystone Exams. Mr. Baysoy holds a Ph.D. and an M.S.E.E both in Electrical and Computer Engineering from the University of Minnesota, as well as a B.S.E.E in Electronics and Communications Engineering.

Scoring Facilities

DRC's scoring centers are secure facilities. Access is limited, through the use of electronic badge access and vigilant front desk staff, to DRC employees and visitors accompanied by authorized staff. Student responses are kept secure at all times. DRC currently operates scoring centers in six locations: Plymouth, Minnesota; Woodbury, Minnesota; Sharonville, Ohio; Columbus, Ohio; Pittsburgh, Pennsylvania; and Austin, Texas. Each of DRC's scoring centers is divided into large, open scoring rooms. Additionally, there is sufficient office space for conferences and small group training. DRC also maintains large break rooms equipped with coffee, tea, hot chocolate, soft drinks, vending machines, and refrigerators. DRC scoring centers are accessible to the physically challenged and conveniently located near major highways and amenities.

Upon award of the contract, DRC plans to open either two or three scoring centers in the state of Florida. These would be utilized to score ELA/Literacy and Mathematics constructed response items for the Florida Standards Assessments. Having a number of Florida scoring centers and employing hundreds of local Florida scorers will provide significant economic benefits for Florida. DRC's Florida scoring centers would also be made available as potential meeting space for use by the Department. Finally, using local scoring centers would also allow the Department to observe firsthand the handscoring activities associated with the Florida Standards Assessments, without extensive travel.

Image Handscoring

Now in its thirteenth year of operation, DRC's Image Handscoring System has proven to be a highly efficient and accurate platform for scoring large-scale assessments. This dynamic system can be used to score paper-and-pencil responses intermixed with responses created in an online testing platform, including other vendors' testing engines. The same stringent measures of quality control, including numerous handscoring reports, are readily available regardless of the mode of response. Therefore,

DRC's Image Handscoring System

DRC's process for scoring computer-generated responses is identical to its process for scoring handwritten responses; this ensures that clients are provided with the fairest scoring environment possible. DRC also employs a bias training to ensure that scorers do not view handwritten responses differently than typed responses.

DRC's Image Handscoring System allows scorers to score online, increasing efficiency by eliminating both the routing of paper and the possibility of lost student answer documents. Instead, student responses are electronically routed to geographically dispersed DRC Scoring Centers. As with past projects on which AIR has partnered with DRC, AIR will securely transfer computer-based test student responses to DRC. DRC will then load the responses into DRC's Image Handscoring System. The responses will then be allocated to scorers through a custom dealer program, ensuring that each scorer is assigned a random workload and allowing the project to be processed in the most efficient manner possible.

With the Image Handscoring System, each open-ended item's position within the assessment is defined through the use of the programmatic Item Definition Application. For each item, the system also requires the definition of possible score values, nonscore values, and applicable scoring rules (e.g., all responses receive two independent reads and responses with non-adjacent scores receive an independent third reading).

The Image Handscoring System provides scorers with the ability to view full-page images from multiple perspectives—such as zooming in/out and image flipping or rotation—in order to correctly interpret written responses. Images remain intact with the various viewing capabilities and cannot be modified by the scorers. Additionally, Image Handscoring functionality applies a set of process rules and client-defined "read-behind" criteria.

Each handscoring site is connected to the main DRC operations facility through a DS3, 45 Mb/S, private circuit. The operations facility has secure database servers and multiple applications that support the scanning, editing, scoring, and handscoring processes. Database backups and archived images are stored off-site on tape media for disaster recovery purposes. Each DRC scoring site has a server and a local area network (LAN). Scorers, team leaders, and scoring directors connect to the LAN via hundreds of PC workstations and use locally resident software to view and score student responses. Authorized on-site DRC personnel (e.g., content specialists, project managers) can access the LAN to recall student responses.

Quality Control of the Handscoring Imaging System

Software Quality Assurance Analysts test the imaging system to verify that all handscoring programs are compliant and in place for performance assessment personnel prior to the transfer of production images. Images produced from test scan files are generated, processed through the handscoring system software, and accessed from the handscoring client software, where Quality Assurance Analysts score the test images using the handscoring criteria and specifications just as they will be in the production systems. Throughout this testing cycle, multiple quality checks are executed to ensure that the data integrity for each student record is intact and accurately reflected in the scoring database.

Additionally, the Image Handscoring functionality applies a set of process rules and client-defined read-behind criteria. This functionality includes a "50% rule" that ensures that one scorer cannot score more than 50% of a student's responses in any given content area, which helps to disperse a student's responses across multiple scorers. This quality control measure ensures that multiple scorers contribute to each student's final results, thereby

producing results that are more psychometrically sound.

Rangefinding

The following plan describes DRC's understanding of the rangefinding process described in the ITN. AIR and DRC look forward to collaborating with the Department in order to fine-tune this process to meet the Department's needs. DRC has significant experience with a number of models of rangefinding and developing training materials. DRC will ensure that comprehensive, high quality training materials are developed with direct input from Florida educators and the Department.

After receiving student responses, DRC content specialists and scoring directors will prepare for rangefinding by using DRC's Image Viewer to access student responses for each open-ended item. They will use the rubrics to select a representative sampling for each score point. The rangefinding responses will also include borderline responses that do not fit neatly into one of the score levels. These examples are included in order to address decision-making challenges that will be faced by the scorers.

AIR and DRC understand that rangefinding will occur at a site in Tallahassee and that each committee will comprise up to 10 Florida educators with a Department staff person acting as chair. DRC will send grade/subject scoring directors and assistant scoring directors to all rangefinding meetings. There will be field-test rangefinding in the spring, field-test and operational rangefinding each fall. Each rangefinding meeting will last 5 days. During the meetings, the rangefinding committee will review and consensus-score samples of student work in order to reach common agreement on the application of scoring rubrics and provide responses for scorer training materials. DRC takes security and confidentiality as seriously in the rangefinding setting as it does in its scoring centers. Consequently, no materials will ever leave the rangefinding rooms, which will always be locked when not actively in use.

The rangefinding process for each item will begin with a review and discussion of the rubric. After an understanding of the scoring guidelines has been established, the rangefinding committee will read and discuss each response until a consensus score is reached. For each item, the committee will score a sufficient number of responses to construct the anchor, training, qualifying, and validity sets to be used in field-test scoring. The committee will move from item to item until all items are complete. DRC's scoring directors/assistant scoring directors will maintain a record of all scores and make careful notes of scoring decisions made by the committees. These notes will be used to annotate the student responses in the anchor sets. They will also be used during scorer training to help ensure that the scorers understand and follow the rangefinding decisions. Finally, notes taken during rangefinding will drive longitudinal consistency of scoring protocol by providing benchmark points for discussions in subsequent years' rangefinding meetings.

After rangefinding, DRC's handscoring staff will be available to meet with Department staff to review the rangefinding responses and compare notes from the meeting. This will ensure that the Department's understanding of how the committees viewed the responses matches DRC's understanding of how the committees viewed the responses. DRC staff will also work with the Department to identify responses to be used as anchors as well as responses to be used as training, qualifying, and validity papers. DRC's scoring directors will write annotations and provide notes necessary for scoring guides as well as any other criteria needed to accurately score each constructed response item. DRC understands that the Department will approve all selections, annota-

tions, and other materials used in the training materials.

Developing Training Materials

Once rangefinding is complete, DRC will utilize the committee-scored rangefinding responses to develop training materials for scoring the field-test responses. DRC will be responsible for the creation of all anchor sets (committee-scored, annotated responses representing each score point) as well as all training, qualifying, and recalibration sets. Scoring directors will select anchor and training papers from the sets of committee-scored, Department-reviewed responses from rangefinding. All notes generated during the rangefinding process will remain with each response selected, either in the annotation (for anchor papers) or in the scoring director's notes (for training/qualifying papers). DRC will submit copies of training materials to the Department for approval prior to their use. Any training material created by DRC can be provided to the Department in PDF format for archival purposes.

Anchor Sets

Each constructed response item will require item-specific training materials, including a scoring guide consisting of the rubric, the passage or scenario (if appropriate), and three to four annotated anchor responses per score point. Anchor papers will be selected to illustrate particular scoring concepts. These responses will help ensure that scorers are able to make accurate and consistent scoring decisions for the response types they are likely to encounter. All anchor papers will be annotated to explain how they exemplify each score point. The scoring guide/anchor set will serve as the scorers' constant reference. DRC will provide the Department with copies of anchor sets for approval before scoring the field-test responses.

Training/Qualifying Sets

For each constructed response item, DRC will also develop a minimum of three training sets and two qualifying rounds of 10 student responses each. DRC will create more training and qualifying rounds for more complex item types, such as passage-based essays. These training/qualifying papers will further hone each scorer's ability to discern the different score-point levels in an accurate and consistent manner. When reviewing training papers from the front of the scoring room, the scoring director will utilize the notes generated during rangefinding to ensure that scorers reach scoring decisions in a manner consistent with the rangefinding committee's thinking. DRC will work with the department to finalize numbers of training/qualifying sets required for each item type and to determine a viable qualifying percentage. DRC will provide the Department with copies of training and qualifying sets for approval before scoring.

Operational Materials

DRC understands that operational rangefinding will take place during the fall. DRC will pull forward the field-test training materials (anchor, training, qualifying, validity, and recalibration sets) for each item selected for an operational administration. DRC will utilize committee-scored responses to supplement these materials (if needed) in order to thoroughly convey scoring criteria as each selected field-test item transitions to operational status. These supplemental materials will further scorers' understanding of how the rangefinding and field-test responses were scored in order to ensure accurate and consistent scoring.

Validity Sets

In addition to anchor, training, and qualifying sets, DRC will select responses for use as validity sets during both field test and operational

scoring. DRC understands that the Department will approve selections for validity sets prior to use. Validity responses can help detect possible room drift as well as individual scorer drift. Validity reports compare scorers' scores to predetermined scores. The validity responses will be "blind" to the scorers; scorers will not be able to distinguish validity responses from live responses. DRC understands that the frequency distribution of scores within the validity pool should closely mirror the frequency distribution of scores generated during live scoring. DRC also understands that, for costing purposes, a validity insertion rate of 1 in 10 should be assumed for extended ELA/L items, while a validity insertion rate of 1 in 25 should be assumed for all other constructed items.

Calibration Sets

DRC will also select recalibration responses throughout the course of scoring operational assessments. Calibration sets are designed to help refocus scorers on how to properly use the rubrics to score responses. These sets will be selected to help illustrate particular points and familiarize scorers with the types of responses commonly seen during the current operational scoring. DRC will create calibration sets of two to three responses and distribute them to all of the scorers on each item each day. After the scorers take the recalibration set, the scoring director will go over the set from the front of the scoring room, using rubric language and the anchor responses to explain the reasoning behind each response's score. DRC will employ extra, or targeted, calibration sets as needed.

Scoring Material Review

DRC understands that each year, at least three months prior to handscoring training for spring administrations, there will be a final materials review meeting to review proposed operational scoring materials. DRC's content specialists and scoring directors for each subject/grade will meet with Department staff to review scoring criteria and field-test training materials, supplement the anchor papers (if necessary) and ensure that DRC and the Department share the same understanding of the scoring criteria as selected field-test items become operational. DRC understands that these will not be committee meetings, but instead will provide a chance for Department content staff to give final input into the training materials before their use in an operational administration.

Selecting and Training Scorers

Recruitment and Selection Process

Because of DRC's highly regarded reputation as a professional, respectful employer, the company is able to maintain a large pool of experienced scorers from which to staff client projects. As needed, this pool is increased each spring through a comprehensive, proven hiring process. DRC selects scorers who are articulate, conscientious, and flexible. DRC's scorers have strong content-specific backgrounds; they are educators, writers, editors, and other professionals. DRC scorers are valued for their professional and academic experience but are required to set aside any biases concerning student performance and accept the scoring standards of each client's program.

With the excellent and well-educated labor pools available near all DRC scoring facilities (stemming, in part, from numerous nearby colleges and universities), DRC is able to tailor scoring staff to each client's program. All DRC scorers have at least a four-year college degree in a relevant field and a demonstrated ability to write. Most scorers have years of experience with scoring large-scale assessments. DRC will make a concerted effort to hire scorers for the Florida Standards Assessments who have prior handscoring experience for other statewide testing programs.

DRC has a human resources coordinator dedicated solely to recruiting and retaining hand-

scoring staff. Applications for scorer positions are screened by the project director, the human resources coordinator, and recruiting staff to create a large pool of potential scorers. During the screening process, preference is given to candidates with previous experience scoring large-scale assessments and with degrees emphasizing appropriate content areas. During required personal interviews, scorer candidates are asked to demonstrate proficiency in program subjects by responding to a DRC-selected topic. Selections are made on the basis of previous handscoring experience, previous educational and work experience, as well as subject area ability and expertise demonstrated during the recruiting process. For the Florida Standards Assessments, preference will be given to scorers who have prior experience scoring responses in the content areas being assessed. DRC's dedicated human resources/recruiting staff are confident in their ability to hire individual scorers for the Florida Standards Assessments that best utilize scorer strengths.

Prior to each scoring session, DRC's content specialists work with human resources/recruiting staff to select scorers based on experience and background. The content specialists will divide the scorers into teams and assign each team a team leader. All of DRC's scorers will be made aware that no scoring materials are to leave the scoring center. They must sign legally binding confidentiality agreements stating that they are aware of the secure nature of the work before training and scoring begins. DRC scorers will be frequently reminded of the importance of confidentiality and security during the course of the project.

DRC insists that scorers work the DRC's full core hours from 8:30 a.m. to 4:00 p.m.; additionally, scorers must be present for each full training session or they will not be allowed to work on that project. This has been a steadfast policy at DRC. Strict adherence to core hours allows DRC to plan timelines accurately for its clients. DRC will take all necessary steps to anticipate the correct amount of time needed for scoring; they realize that staying on schedule is of the utmost importance in order for student results to be reported in a timely manner.

DRC understands that all scorers who work on the FSA will have their degrees verified by an independent, third party verification organization and that any scorer for whom a degree cannot be verified before the start of live scoring will be dismissed. Potential scorers in Florida may include retired Florida teachers and substitute teachers provided they are not actively teaching in Florida's public school system for the remainder of that year.

Training Team Leaders

Before scorer training begins, DRC will provide team leaders with comprehensive training. Team leader training will last approximately 2 days and follow the same process used in the scorer training (detailed below), although it is more comprehensive due to the training and oversight responsibilities required of the team leaders.

During their training, team leaders will be required to annotate all of their training responses with official Florida annotations. To promote room-wide scoring consistency, it will be imperative that each team leader imparts the same rationale for the score assigned to each training response. This consistency will ensure that scorers assign the correct scores for the correct reasons. Once the team leaders have qualified for operational scoring, they will prepare for the arrival of their teams of scorers. Teams typically consist of 10–12 scorers per team, although DRC will utilize smaller teams if there is a need to increase the number of team leader backreads.

Training and Qualifying Scorers

DRC welcomes the Department to oversee the training process for the Florida Standards

Assessments through visits to DRC's proposed in-state Florida scoring centers, conference calls, and the review of handscoring reports. DRC will also provide access to handscoring reports throughout each scoring session.

The training, which is specific to each item, will begin with a room-wide presentation and discussion of the rubric which defines each score point. After reviewing the rubric, the scoring director will review the anchor set. The anchor sets contain multiple examples of each score point, each with an annotation that explains the response's score using language from the rubric. Each scorer will be supplied with a paper copy of the scoring guide, rubric, and anchor set so that he or she can easily reference these materials while scoring responses. The rubrics and anchors are secure materials that do not leave the scoring room.

After reviewing the rubric and anchor responses, the scoring director will train the scorers on how to use the Image Handscoring System. During training, scorers will be seated at imaging stations and grouped by team. Each scorer will be assigned a unique ID number and password for logging in to DRC's Image Handscoring System. The scorers will log in to the Image Handscoring System to access training and qualifying sets in order to continue their item-specific training.

Once the scoring director has helped the scorers log into the Image Handscoring System, the scorers will access training sets, which will serve as an opportunity to practice scoring. The entire room will work on one training set at a time. After the scorers complete each training set, the scoring director will review reports that detail how each scorer performed and how each response within the set was scored. Next, the scoring director and/or team leaders will use this information to lead a thorough discussion of each set, answering questions to help ensure that the scorers understand the proper way to apply the rubric to each of the training responses.

For operational assessments, after the scoring guide and all training sets have been discussed, scorers, just like team leaders, will be required to demonstrate their ability to apply the scoring criteria by qualifying (i.e., scoring with an acceptable agreement rate agreed upon by the Department) on at least one of the qualifying sets. The scorers will access the qualifying sets via the Imaging System so that their scores can be captured and reported. Any scorer who does not qualify by the end of the qualifying process will not be allowed to score actual student work.

Scoring Procedures

DRC believes that its training, scoring, qualifying, and monitoring processes are the best in the industry. All of these processes have been used for years to successfully score large-scale assessments similar in scope, size, and complexity to the Florida Standards Assessments. DRC will uphold the same level of dedication to accuracy and quality for this program.

DRC's general scoring procedures are summarized below:

- **Scorer Training and Qualifying**
  - Scorers are seated at imaging stations and are assigned unique ID numbers and passwords.
  - The scoring director provides detailed directions for use of DRC's computerized handscoring system.
  - The scoring director trains the scorers using item-specific anchor sets and training sets.
  - Scorers must demonstrate scoring proficiency on item-specific qualifying sets before scoring live responses.
- **Routing Responses to Ensure "Blind" Second Reads**
  - The Image Handscoring System ensures that responses are routed to qualified

scorers until the prescribed number of reads is performed for all responses.

  - Scorers cannot tell if they are the first or second scorer.

- **Monitoring Scoring (Handscoring Quality Control)**
  - Ongoing quality control checks and procedures monitor and maintain the quality of the scoring sessions. If unusual data are observed, DRC will investigate and resolve any issues.
  - Responses can be retrieved on demand (e.g., specific batch files, specific grades, specific students) should the need arise during or subsequent to the handscoring process.
  - If needed, responses can be rescored based on item- or response-level information, including item number, date, score value assigned, or scorer ID.
- **Handling Unusual Responses**
  - Scorers can forward responses to team leaders for assistance.
  - Responses requiring special attention, including nonscorables and alerts, are routed to scoring directors for review and resolution.

Routing Responses to Ensure "Blind" Second Reads

DRC's Image Handscoring System separates responses by item and subject and routes to qualified scorers who read each response and enter the score. The process of routing and scoring responses continues until all responses have received the prescribed level of readings. Scorers cannot tell if they are conducting first or second readings; all readings are "blind."

Because of the high stakes associated with the Reading portion of the Grade 3 ELA/L the entire grade 10 ELA/L assessments, AIR has devoted extra handscoring resources to these tests. Specifically, these assessments will be double human scored when delivered on paper, and the responses to the grade 10 Writing prompts delivered online will be both machine and human scored, with 100% human resolution of any difference between the scores. For the high-stakes Algebra I assessment, all constructed responses on paper tests will be double human scored, with resolution of nonadjacent scores. For responses writing prompts in all other grades, 25% of the machine-scored responses will be routed to human scorers based on algorithms identifying potentially anomalous responses. For all other portions of the assessment, 20% of the responses will receive a second reading for the purpose of monitoring and maintaining sufficient inter-rater reliability. DRC will work with the Department to establish a specific set of scoring rules for resolving disagreement between first and second readings by utilizing subsequent independent readings performed by team leaders and scoring directors.

Handscoring Quality Control

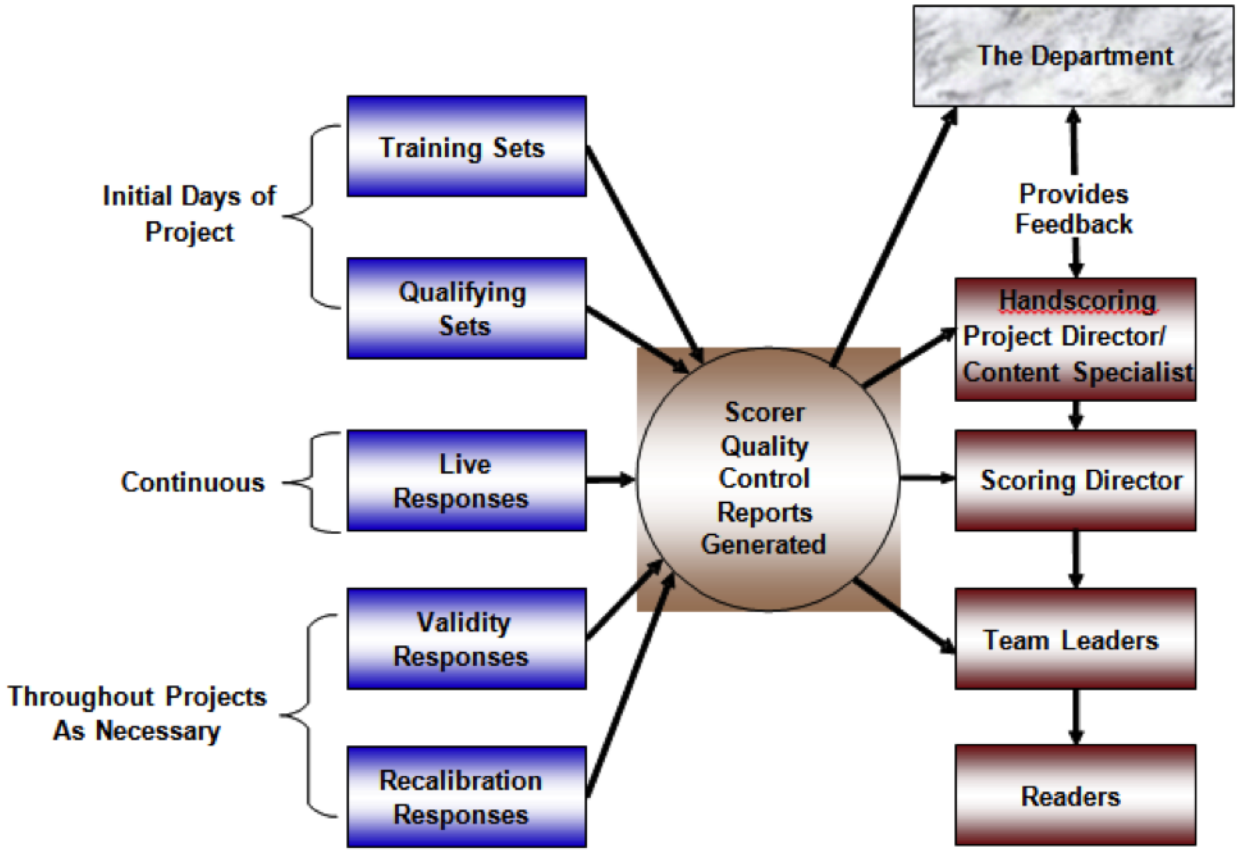
DRC's scorer quality control monitoring/reports system is shown in Exhibit 7.5.4.5-1.

Monitoring Scorers

DRC runs handscoring reports on demand in order to monitor progress and maintain handscoring quality control. The Department will be given access to all handscoring reports to be run as needed. Reports will also be automatically generated overnight. DRC will provide the Department with access to these reports in PDF format on a daily or on-demand basis.

During the handscoring process, the scoring directors will meet with their team leaders each morning to review the statistics generated from the previous day's work. If scoring patterns are apparent among individual scorers, team leaders will deal with these issues on an

Exhibit 7.5.4.5-1: Scorer Quality Control Monitoring/Reports System



individual basis. DRC's imaging system allows a team leader to determine read-behind rates (frequency of monitoring) for each scorer. If a scorer appears to need clarification of the scoring rules, or is scoring tentatively, DRC will monitor one out of five readings, making adjustments to that ratio as needed. The imaging system will randomly select which images the team leader monitors.

DRC will also monitor the inter-rater reliability. If a scorer falls below an acceptable rate of agreement, the team leader will retrain the scorer. If a scorer fails to improve after retraining and feedback, DRC will remove the scorer from the project. In this situation, DRC removes all scores assigned by the scorer in question. The responses will then be re-dealt and rescored.

DRC monitors attendance of their scorers closely. DRC understands that any scorer who is absent for two or more days consecutively while scoring any portion of the FSA, will have to retrain/re-qualify before again scoring live student work. DRC's scoring directors will ensure that this retraining/re-qualifying process occurs in an orderly fashion. Any scorer who fails to re-qualify will be released from the project.

DRC does not report on scorer performance after the fact, as some contractors do. DRC believes that scorers with less-than-acceptable scoring patterns must be identified immediately and those patterns corrected. DRC has worked diligently to devise effective monitoring reports and procedures to accomplish both detection and correction. Accurate and consistent results are the backbone of all handscoring activities. The following methods used by DRC guarantee scoring quality:

- Rigorous **training and qualifying** for each item, as detailed earlier in this proposal, ensures a pool of scorers who will apply consistent and accurate scores.
- **Daily review/calibration** occurs each day of the project in the form of a morning review of selected papers from the Scoring Guide and an afternoon two- to three-paper calibration set consisting of Department-approved responses.
- **Recalibration** sets re-focus scorers on the scoring standards by comparing the predetermined score to that assigned by the scorer.
- **Validity** responses detect possible room drift and individual drift. Validity reports compare scorers' scores to predetermined scores. Validity responses are seeded to scorers. Scorers cannot distinguish validity responses from live responses, making this a powerful measure of quality control.
- Team leaders conduct routine **read-behinds** to observe, in real time, scorers' performance. Team leaders utilize live, scored responses to provide ongoing feedback and, if necessary, retraining for scorers.
- **Inter-rater reliability and score point distribution reports** are generated daily or on demand to monitor scorer reliability and maintain an acceptable level of scoring accuracy. The reports compile individual scorer data, including scorer identification number, number of responses scored, individual score point distributions, and exact agreement rates. DRC will investigate any issues and resolve any problems identified by the reports. DRC is proud of the scorer quality control reports that it has developed for handscoring projects.

Quality Control Reports

AIR and DRC look forward to consulting with the Department to determine the best way to make program handscoring reports available for use by the Department. AIR team member DRC is proud of its suite of quality control reports developed specifically for handscoring projects. DRC will provide the Department with annotated samples of all its handscoring reports so that a determination can be made as to which reports the Department would like access to and how best to customize those reports for the Florida Standards Assessments. The same reports will be generated during operational and field test scoring. Because handscoring quality reports are produced in real time, the Department can be assured that immediate action will be taken to resolve scoring discrepancies, within minutes if necessary, of the first and/or second reading. AIR is confident that DRC will supply handscoring reports to meet the Department's needs. Please see Appendix L for sample DRC quality control reports.

If requested, DRC will convert the handscoring reports into an agreed-upon format and send them to the Department on a weekly, bi-weekly, or daily basis. It is also DRC's practice to provide clients with summary handscoring reports as well as project technical reports. DRC plans to continue this practice with Florida, thereby ensuring that these materials will be available for review at the annual handscoring debriefing meeting.

DRC currently uses a number of reports to monitor the quality and/or effectiveness of various aspects of handscoring projects. DRC's reports have multiple parameter selections, so often more than one individual report is included under the same report name. DRC looks forward to tailoring these reports to meet the Department's needs. Exhibit 7.5.4.5-2 describes some of the quality control reports that are provided for many of DRC's assessment clients.

DRC is experienced at producing the handscoring reports identified by the Department in the ITN. Below, the reports identified in the ITN are correlated with the DRC's typical handscoring quality reports described in Exhibit 7.5.4.5-2:

Exhibit 7.5.4.5-2: Quality Control Reports

Report	Report Specifics
Scoring Summary Report	DRC's *Scoring Summary Report* provides daily and cumulative inter-rater reliability results, score point distribution data, and production volumes for each reader and item. **Inter-rater Reliability** Monitors how often scorers are in exact agreement with each other and ensures that an acceptable agreement rate is maintained. This report provides daily and cumulative exact and adjacent inter-scorer agreement and the percentage of responses requiring resolution (only if required). The calculations for this report are as follows: • **Percent Exact**—total number of responses by scorer where scores are equal divided by the number of responses that were scored twice. • **Percent Adjacent**—total number of responses by scorer where scores are one point apart divided by the number of responses that were scored twice. • **Percent Non-Adjacent**—total number of responses by scorer where scores are more than one score point apart divided by the number of responses that were scored twice. **Score Point Distribution** Monitors the percentage of responses given to each of the score points. For example, for items on a 0–4 point scale, this daily and cumulative report shows how many 0s, 1s, 2s, 3s, and 4s a scorer has given to all the responses he or she has scored at the time the report is produced. These percentages can be compared to room-wide percentages to detect individual scoring issues. **Production Volumes** This report also indicates the number of responses read by each scorer each day so that production rates can be monitored. Additionally, it includes totals for each item, so that progress toward completion can be monitored.
The Item Status Report (Completion Reports)	Monitors the progress of handscoring. This report tracks each response and indicates the status (e.g., "needs a second reading," "complete"). This report ensures that all discrepancies are resolved by the end of the project. Information from this report will be used to create room-specific Daily and Cumulative Completion Reports to compare on a daily and cumulative basis the number of readings completed in comparison to projected completion targets.
The Read-Behind Log	Used by team leaders/scoring directors to monitor scorer reliability. Team leaders randomly select and read scored responses from each team member daily. If the team leader disagrees with the scorer's score, remediation occurs, with either the team leader or the scoring director. This has proven to be a very effective form of feedback because it is implemented with items live scored by individual scorers.
Training/Qualifying Reports	Training and qualifying records are kept on every reader for every set taken. These reports can be run using various parameters to meet the needs of the Department (by performance task or set, reader, team, by site/grade/subject) and can be run daily or cumulatively. These reports include the information described in the ITN as the Cumulative Training Report by Reader; Cumulative Training Report by Document; Cumulative Qualifying Report by Reader; Cumulative Qualifying Report by Document.
Recalibration/ Validity Reports	These two processes are conducted throughout the entire scoring session. Both processes compare predetermined scored responses to readers' scores for the same set of responses. Additional responses are given to individuals if the scoring director feels it is warranted. These reports can be run at the individual, team, or room level in order to detect individual, team, or room-wide scorer drift.
Reader Summary Report	This report, which is similar to the Timing Reports, provides, by site, by team, and by item, the daily and cumulative number of readers engaged in scoring and the daily and cumulative number of responses read by each reader. DRC will work with the Department to enhance this report so that it provides the information needed from the Timing Reports.
The Responses Read by Reader Report	Identifies all responses scored by an individual scorer. This report is useful if any responses need rescoring due to potential scorer drift.

1. **Cumulative Training Report by Reader**—DRC report name: Training/Qualifying Reports
2. **Cumulative Training Report by Document**—DRC report name: Training/Qualifying Reports
3. **Cumulative Qualifying Report by Reader**—DRC report name: Training/Qualifying Reports
4. **Cumulative Qualifying Report by Document**—DRC report name: Training/Qualifying Reports
5. **Cumulative Reader Performance Report**—DRC report name: Training/Qualifying Reports, Validity Reports, Scoring Summary Report
6. **Daily and Cumulative Score Point Distribution**—DRC report name: Scoring Summary Report
7. **Daily and Cumulative Validity**—DRC report name: Recalibration/Validity Reports
8. **Daily and Cumulative Inter-rater Reliability**—DRC report name: Scoring Summary Report
9. **Score Point Distribution for Standard Curriculum Students**—DRC report name: Scoring Summary Report
10. **Daily and Cumulative Score Point Distribution and Inter-rater Reliability by Reader**—DRC report name: Scoring Summary Report
11. **Daily and Cumulative Validity by Reader**—DRC report name: Recalibration/Validity Reports
12. **Daily and Cumulative Validity by Validity Set**—DRC report name: Recalibration/Validity Reports
13. **Daily and Cumulative Read-Behind Reports**—DRC report name: Read-Behind Reports
14. **Daily and Cumulative Timing Report**—Similar to DRC's Reader Summary report, which will be modified with input from the Department and named Timing Reports
15. **Daily and Cumulative Completion Report**—DRC report will be created with input from the Department using data from the Item Status Report

Handling Unusual Responses: Alerts and Nonscorables

DRC will apply a nonscorable code to unusual or aberrant responses that cannot be assigned a score. Prior to scoring, AIR and DRC will work closely with the Department to define what constitutes a nonscorable response. During handscoring, DRC will contact the designated Department representative to obtain a ruling on any response that cannot be assigned a score or a nonscorable code based on current understanding. The Image Handscoring System has a built-in functionality that can be used to forward all potential nonscorable responses to the scoring director. Only the scoring director will be able to assign the nonscorable code.

To handle possible alerts (responses indicating potential issues that may require attention at the state or local level, such as potential security breaches or concerns about a student's safety), DRC's Imaging Handscoring System gives scorers the ability to alert individual student responses. Alerted images are routed to the scoring director who will print any responses deemed to indicate a potential issue. At no time during scoring do scorers have access to any demographic information of any students.

Next, these alerts are routed to a handscoring senior manager who reviews them and, if needed, sends copies of the student's responses to DRC Project Management staff. The DRC project manager will forward copies of the alerts to the Department. If the Department would prefer a different process for handling alerted responses, AIR and DRC would be happy to review and tailor the process with the Department upon award of the contract.

7.5.5 Reporting

AIR is pleased to offer multi-modal delivery of reports. We recognize the critical need for paper reports to go home to parents, and AIR has led the industry in design reports that parents clearly understand and can act on. We also recognize that printed reports can offer only a limited view of data. You cannot drill down into interesting statistics when they are presented on paper. AIR's mature online reporting system allows educators to interact with the data, slicing, dicing, and exploring the data to uncover implications for their students.

All of our reporting systems, paper and online, bear the responsibility of communicating to stakeholders (parents and students in particular) who are not technical measurement experts. While most psychometricians deem reports valid if the information they *present* is true, we recognize a greater validity burden on our reports.

We strive to have our online reporting system and our paper reports *convey* information that is correct. It is not sufficient to say something true, we must say (or show) it in such a way that the typical reader is likely to understand it in a correct and useful way. Only when this communication goal is met can the reports serve their real purpose—to help parents and educators contribute to student learning.

We achieve this goal by applying principles of cognition to the report design. For example, we know that the human eye will group together or equate things that are the same color. Having different things share a color can cause confusion. Having things that *should* be compared be the same color can cause the comparison to happen without conscious effort on the part of the reader.

AIR offers an online reporting system that will

- speed the distribution of results to schools, districts, and families;
- provide secure interactive reporting capabilities that allow educators at all levels to explore the data and their implications for instruction; and
- reduce costs by eliminating the need to produce and ship CDs and paper reports for schools and districts.

All of these benefits accrue while simultaneously improving data quality and extending the range of data quality review through automation.

The online reporting system will generate dynamic, interactive reports for educators and allow educators to generate data files, speeding the delivery of these files. The online reporting system also supports individual student reports, which are typically available to schools and teachers. In many states these reports constitute the parent reports, which schools print and ship to parents. Here, in accordance with the ITN requirements, we propose a separate paper parent report. The online reports are highly configurable, but the system design imposes some limits on what can be displayed. AIR's paper reports are the most flexible available in the industry.

Given the rapidly changing landscape of online assessment, reporting solutions based on conventional processes that involve producing static PDFs and shipping data files on CDs can be inefficient and costly. The Department's invitation to submit proposals based on innovative solutions that take advantage of mature technologies in online student assessment is especially relevant to reporting student scores.

AIR's plan offers Florida a streamlined, transparent process that will speed reporting while preserving every aspect of Florida's current quality processes. In most of the states in which we work, the data are made available to

educators immediately, but considered preliminary until the final data delivery to the department at the end of the year. The real-time reporting combined with real-time ID (see Section 7.5.2) and the continuous data cleanup period (see Section 7.5.6) will speed reporting, which will enable Florida to move the testing window closer to the end of the year. The continuous cleanup process will improve transparency, while moving the demographic cleanup off the critical path by making cleanup possible during the testing window.

Our solution has been successfully used for years in Oregon, Ohio, Florida, Hawaii, Delaware, Florida, and Minnesota. We believe that the solution we outline below for reporting the English Language Arts/Literacy (ELA/L), Mathematics, and End-of-Course (EOC) assessments offers several benefits to Florida educators including

- rapid, flexible online reporting, providing both standard and customized reports, available immediately (upon completion of scoring for human-scored tests);
- access to the Online Reporting System for users to download on demand, standard and custom PDFs, spreadsheets, and data files;
- custom-designed, full-color paper reports for parents to understand the full meaning and import of student and school scores;
- proven ability to successfully deliver paper score reports at scale and on time;
- benchmark reports for educators that identify strengths and weaknesses at the benchmark level for the class (this feature is psychometrically viable for adaptive tests or with a sufficient number of operational fixed forms spiraled within classrooms); and
- mobile-compatible online reports that teachers can access on tablets or even smartphones.

Should the Department decide to continue providing static PDF reports for schools and districts and data files on CDs as is currently done, AIR commits to producing these deliverables outlined in Section 7.5.5 of the ITN. However, the solution we propose is able to more efficiently meet all of the reporting requirements outlined in the ITN, including reporting scores for multiple assessments (EOC and ELA/L and Mathematics assessments); reporting scores for assessments with handscoring components; delivering multiple data files; and distributing score results within exceptionally short timeframes. Most importantly, the Online Reporting System described in the following pages

- provides all of the same data users currently receive;
- provides districts, schools, and teachers with valuable additional data;
- offers users the ability to customize their reports;
- enables users to immediately generate their own data files; and
- generates PDFs on demand for use in professional development activities.

To highlight the differences between our proposed solution and Florida's current reports, we provide a visual comparison of the two reporting methods in Exhibit 7.5.5-1.

Our Online Reporting System is designed to support educators as they evaluate the needs of their students and reflect on their own curricula and practice. When educators enter the system, they immediately see summary data about their students: district personnel see summary data about the whole district, and teachers see aggregates of the students in their

classes. Clicking on any piece of data enables the user to explore the data underlying the aggregate, drilling into progressively smaller groups of students, disaggregating the content by strands or other reporting categories, or tracking students back in time to examine trends. This interactive approach helps educators at all levels leverage the data to improve instruction.

To help identify the considerations that the Department may want to review in making this decision, we also provide a top-line comparison of our proposed automatic online reporting solution with Florida's current reporting methods for schools and districts in Exhibit 7.5.5-2.

As illustrated in the Exhibit, moving away from static PDF reports to an interactive online reporting system will allow Florida schools and districts to view exactly the same data they currently receive while providing them with valuable added data and functionality including the ability to

- download data files delivered immediately upon completion of handscoring through ORS;
- generate on-demand PDF versions of reports for stakeholders to distribute and use in professional development activities;
- generate reports that include data on Florida's subgroups;
- access class-level data for teachers (we will interface with the Department's rostering system to report by teacher and class);
- build customized online reports through a series of filters (demographic filters, accommodation filters, longitudinal filters, etc.);
- build custom rosters for groups of students;
- investigate data by drill-down capabilities;
- access longitudinal data in the form of trend reports at the student, class, school, and district levels;
- access benchmark reports at the class level, if the assessment design supports it; and
- access any of the above data on tablets.

The discussion that follows is divided into four sections:

- An overview of the Online Reporting System
- A summary of our online capabilities and a detailed comparison of Florida's current reports with what schools and districts would receive using AIR's Online Reporting System
- A description of the processes we use to produce the online reports and ensure quality assurance
- A description of our paper report development processes and our quality assurance processes for these reports

Online Reports

Overview of the Online Reporting System

To help users quickly locate the data they need, navigation in the reporting system is designed to mirror the instructional decision-making process. The user can intuitively navigate in any of the three dimensions inherent in the data, and these three dimensions parallel the three kinds of questions that the data can help the user answer:

1. Who? The data can be displayed at levels of aggregation anywhere from the individual level for a specific student up to the entire state. Demographic breakdowns are immediately available at any level of aggregation.

Exhibit 7.5.5-1: Comparison of AIR's Proposed Reporting Solution and Florida's Current Reports

AIR's online reporting system includes exactly the same data as Florida's PDF reports *and* provides users with additional data and functionality...

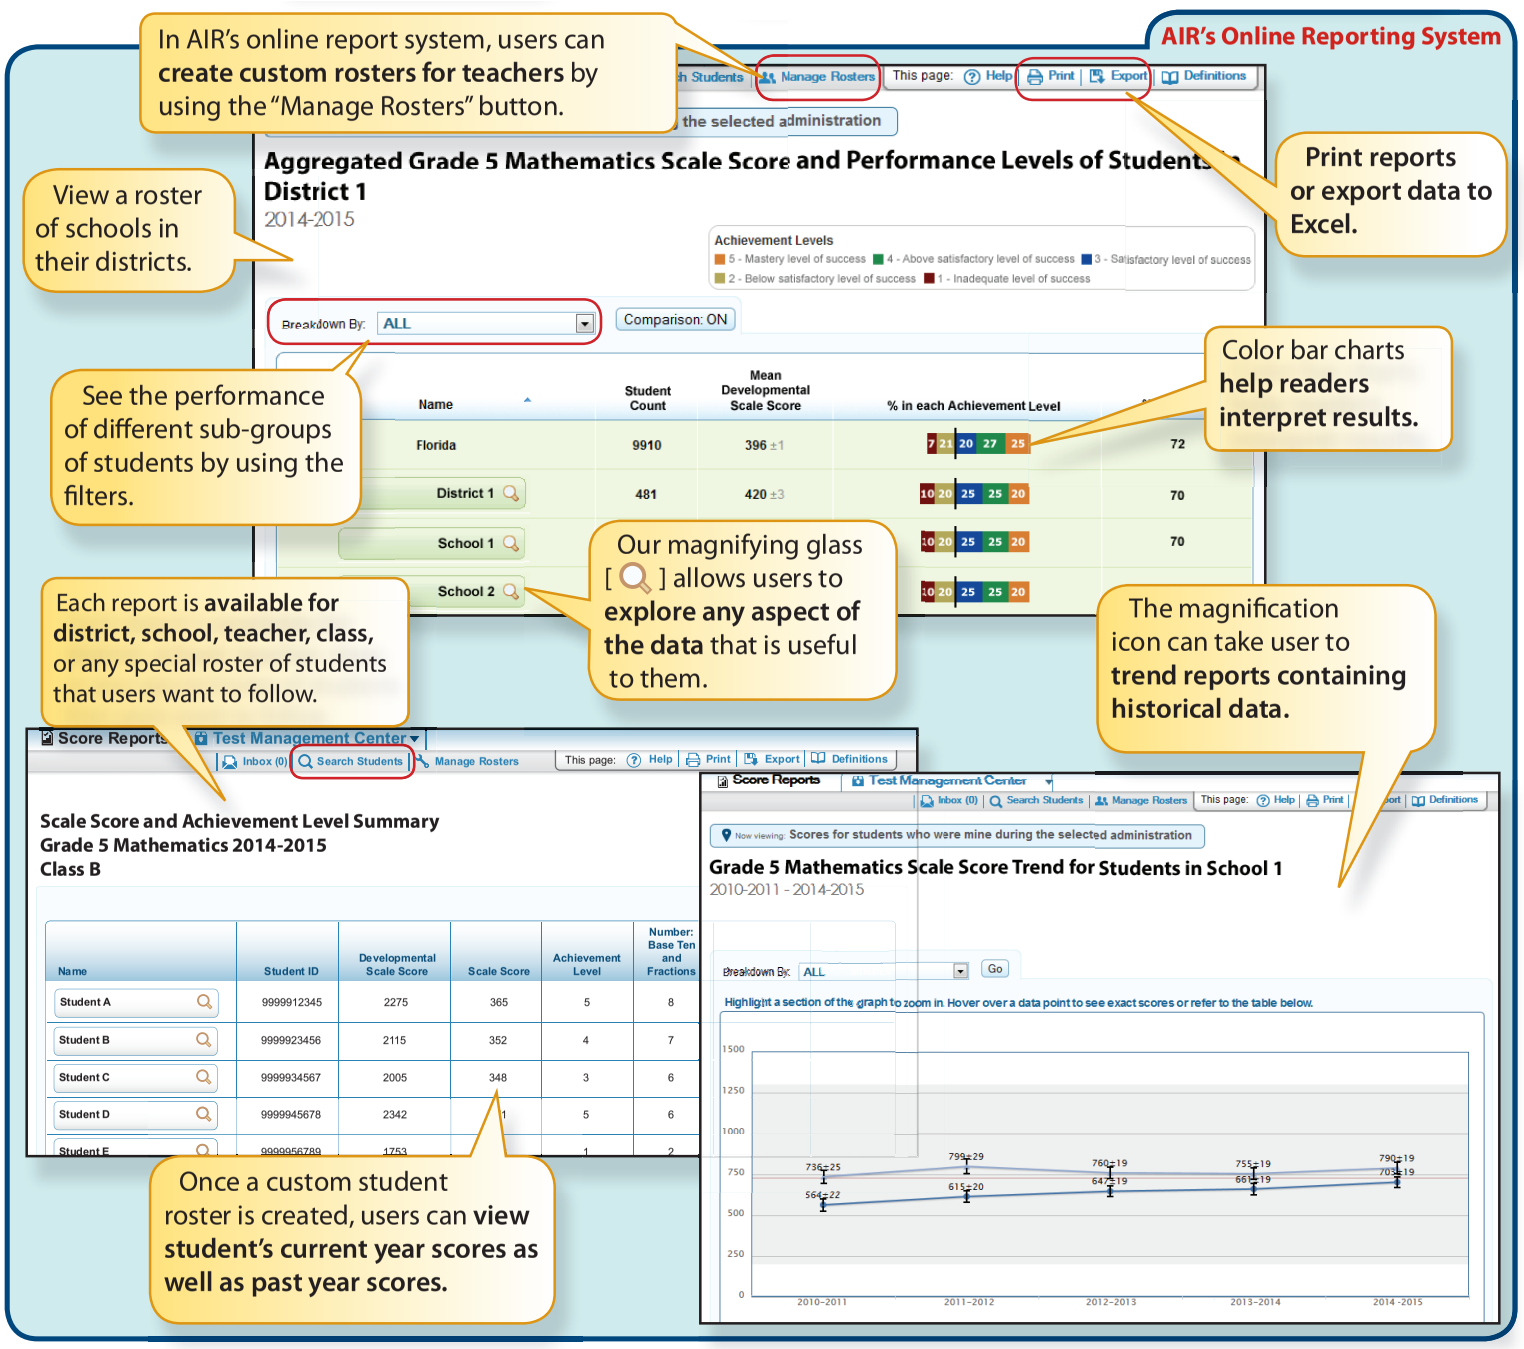
Current PDF reports in Florida contain a static view of the data; **what you see is what you get.**

Florida's current reports provide lots of data, but the **presentation does little to guide users on how to use it.**

No teacher or class level data is provided.

Districts and schools currently receive a report containing results for all schools in the state, and a separate demographic report containing sub-group data.



AIR's Online Reporting System
In AIR's online report system, users can **create custom rosters for teachers** by using the "Manage Rosters" button.
Print reports or export data to Excel.
View a roster of schools in their districts.
See the performance of different sub-groups of students by using the filters.
Color bar charts **help readers interpret results.**
Our magnifying glass [ ] allows users to **explore any aspect of the data** that is useful to them.
Each report is **available for district, school, teacher, class,** or any special roster of students that users want to follow.
The magnification icon can take user to **trend reports containing historical data.**
Once a custom student roster is created, users can **view student's current year scores as well as past year scores.**

Exhibit 7.5.5-2: Topline Comparison of Current Reporting Method to AIR's Online Reporting System

Features of Current Method of Delivering Static PDFs to Schools and Districts	Features of Accessing Interactive Data in AIR's Online Reporting System (ORS)
Users must wait to receive PDF reports and CD shipments	All reports, data, and data files are available immediately upon completion of handscoring and can be batch printed or exported to Excel
Teachers do not receive any class-level data	Custom class rosters and class-level data are available for teachers and can be used for professional development activities
PDF reports contain one static view of the data	ORS provides users with the ability to build custom views through a series of filters and print or download these reports
Users must synthesize data across multiple PDF reports to identify a trend	Users can investigate data trends immediately by using ORS's drill-down capability
Districts and schools must wait for late batch reports and data files to arrive on CD	As late batch records are processed, they are populated in ORS and data files are available immediately for users to download
Currently, districts and schools do not receive trend data	Trend data at the student, class, school, and district levels are available in ORS
Must piece together past year data to identify how a teacher's current class performed in the previous year	ORS automatically provides educators with past year data on their current cohort of students, even if students changed districts or schools
Districts must wait to receive their own hard copies of individual student reports	Districts and schools can print a PDF of the student report from ORS immediately upon availability
Must manage and archive multiple PDF reports and CD shipments for ELA/L and Mathematics assessments, late batch shipments, and quarterly EOC reports and CDs	ORS eliminates multiple sources of reports for multiple assessments (all EOC reports and ELA/L and Mathematics reports, PDFs, and data files are accessible in a centralized location)

2. What? The subject area data can be broken down into finer or coarser "chunks" of content. Navigating this dimension allows the user to travel from subject to content strand to benchmark and back.
3. When? When data are available over time, the system allows the user to view a data trend over time or toggle to a fixed point in time.

Each navigational step changes the reporting display, providing richer context when interpreting class performance or an individual student's performance. The system, of course, contains many reports. However, the interface design encourages users to think about the substantive, educational questions to which they need answers and access information from that perspective. As test results come pouring in from the tests, the reporting system provides stakeholders with immediate access to the information they need about students' strengths and weaknesses.

Summary of Online Reporting Capabilities

AIR's Online Reporting System can replace schools' and districts' static reports with dynamic, timely reports that are designed to complement the instructional decision-making process. Users can securely access their data from anywhere, and role-based access ensures that users have access only to the relevant data that they have access to. Users have complete control over their reporting experience—nearly every page provides a data display, and

users can change data dimensions, sort data, disaggregate data, and show/hide data instantly using a range of filters and features. Next, we provide a description of these specific features and capabilities of the Online Reporting System.

Delivery of District and School Data Files

Currently in Florida, districts and schools access their data files only after all of the hand-scored files are loaded onto CDs and into the Online Management System. With AIR's Online Reporting System, the Retrieve Student Results tool allows users to export a raw data file for district, school, teacher, or roster as the data becomes available. For example, as a class or school completes the ELA/L and Mathematics tests and handscoring is complete, these data will be available in the Online Reporting System immediately.

In Section 7.4.8, we recommend that the Department establish a date after which the data are considered final, allowing authorized district personnel to update demographic, enrollment, and other data through TIDE until that date. These changes appear in the reporting system and data files in near real-time.

The reporting system enables users to request a data file for that class, school, or district at any time. This feature proves very helpful during the cleanup process, as many districts can use this data to automate their data checking and cleanup.

The specific content of the data files is configurable and will be determined by the Department. Data files can be configured to include students' identifying information, student demographic information, test participation status, and performance information at the subject and subscore levels. The files can be exported into Microsoft Excel or other delimited file format so that they can be easily loaded into other software platforms. The reporting tool will also temporarily store the file for a set period of time so that the user can access it later. We propose to deliver all of Florida's current data files, including the SSR, SAR, DSRs, DARs, and late batch SSR and DSR and the demographic SAR, DARs, and DSRs, to schools and districts using this streamlined delivery capability.

In addition to the raw data files in the Retrieve Student Results tool, users can export any table on any report in the reporting system. An "Export" button is available on every report, and the user can immediately export the table as an Excel file. Printed tables carry with them a footnote indicating the data on which the report was generated.

On-Demand PDF Copies of Reports for Stakeholders

An individual student's report can be printed or saved as a PDF file. The PDF format makes electronic distribution easy and ensures that the report will print properly regardless of the user's browser. Users can batch print or save multiple students' reports in PDF format. The reporting tool can also PDF versions of students' written responses for writing tests. This capability will allow Florida schools and districts to print their own copies of student reports instead of waiting for these reports to be shipped to districts.

AIR recognizes the importance of providing parents a printed copy of a report, and this proposal includes printing and shipping of parent reports. These processes are described below.

Custom Rosters and Disaggregated Data

In addition to the expected aggregated reports for a district, school, teacher, and class, the reporting tool allows users to create custom

rosters of students so that they can be tracked and reported on separately. For example, a teacher may teach a group of students in his or her class who are receiving extra help after school and may want to track their progress separately. He or she can create a second roster of only those students to report on their aggregate performance from the group. This may help the teacher to begin to answer questions about the effectiveness of the extra help or the strengths and weaknesses of this subgroup of students. All aggregated reports are calculated from the student level up, so as new students test, reports for the roster, teacher, school, and district are updated instantaneously.

All aggregate reports in the reporting system can also be disaggregated by subgroups defined by the Department. For example, reports can be disaggregated by demographic characteristics like gender, ethnicity, or English language learner (ELL) status. The reporting system can also be configured to disaggregate by multiple characteristics at once (e.g., gender by ethnicity).

Reporting on Multi-Year Student Data

When a user logs in to the reporting system, he or she is automatically taken to his or her reports for the current test administration. Educators can track their current students back in time, a capability that helps teachers understand where students may have faced challenges or exhibited strengths over time.

When reflecting on his or her own practice, a teacher can review reports for students from past administrations, but only for the years leading up to and including the year he or she taught those students. As long as the user is authorized to use the reports, the user can access any of his or her reports from any test administration with the click of a button, even if the students from those years have changed schools or graduated.

Similarly, users can access previous years' scores for their new students. For example, a middle school teacher may begin teaching a class of students who have come from multiple elementary schools. Though the middle school teacher is not authorized to view the school reports for the elementary schools, the teacher can create a report based on the students' previous test scores. This allows the teacher to assess the strengths and weaknesses of the class and of individual students based on their previous scores and adjust instruction accordingly.

Customizability

All text and measures in the reporting tool are configurable, and AIR reporting staff will work closely with the Department to define all text and measures as part of the specifications development (see Section 7.5.1 for more detail about Reporting Specifications). The reporting system can accommodate different kinds of data, and various reporting elements are available (e.g., barrel charts, bar charts, trend charts) to help best display those data.

The user can also customize his or her reports with some of the system tools. Users can choose to show or hide comparison data on their aggregate reports. Users can also choose to show or hide individual columns in a table. In addition, a user can sort most columns in ascending or descending order to group reports by categories such as score, performance level, or demographic subgroup.

Drill Downs

The report navigation is designed to allow the user to drill down through the different dimensions of their data. For example, a user can move from the school reports to the teacher

reports to the roster reports to the individual student reports. At any point, the user may also want to switch from subject-level reports and drill down into the subscore reports or benchmark reports. The user can also switch from a specific administration to view a trend report over time. This flexibility allows the user to drill down to any desired level of granularity in the data and then modify dimensions of the report with a couple of clicks without having to go back to the beginning and drill down again.

Mobile-Compatible Reports

All reports and features of the Online Reporting System are tablet accessible. For example, as a teacher walks around the classroom, he or she can use a tablet to access the Plan and Manage Testing tab to confirm which students have completed their tests. If a student cannot remember his or her login credentials, the teacher can quickly use the Student Search feature to find this information. In addition, all tables and data displays adjust to the tablet screen size making it easy to view rosters, request downloadable data files, or view any number of custom-created reports.

Transfer of Return Files to the Department

Student data files will be provided to the Department on a regular basis and will be transferred via a secure FTP site. The Department can specify how frequently the data files should be posted (e.g., nightly, weekly), as well as the data file layout.

Report Security and Control of Access

The reporting tool belongs to AIR's suite of programs and can be accessed through the Common Login System (CLS), which allows educators and administrators to seamlessly move between authorized programs without having to reenter their login information.

Secure access rules can also be set up to allow parents to view their child's individual student report electronically. When a user logs in for the first time, he or she must agree to the terms of a non-disclosure agreement before using the reporting tool. The reporting system also monitors each user's session. The system will automatically log the user out after a period of inactivity.

Educators and administrators can have different user roles, which are defined in the TIDE system. These user roles can be defined by the Department and will specify which reports users have access to. When a user signs in, he or she will only see the reports and student data to which he or she has access. Besides ensuring that users do not have access to unauthorized reports, this also helps to improve the user experience by only displaying data and reports that are relevant to the user. For example, when a principal logs in, he or she will only see the information for the students and teachers in his or her school. As with all of our systems, student data are protected by the same physical, network, and software security as our test delivery system. Please see Section 7.4.8.4 for more details.

Interpretation of the Reports

AIR knows that a report is not useful if it is not interpreted validly. The reporting tool's design, layout, graphical displays, and use of color have all been implemented based on rigorous focus groups conducted with educators, administrators, and parents. Navigation emphasizes the context of a student's performance by relating it to aggregate performance and trends over time. Colors associated with performance are used consistently throughout the report, and graphical displays are chosen carefully to maximize the amount of information conveyed. For example, bar charts can illustrate the percentage of a teacher's students at each performance level, but the relative

positioning of each teacher's bar chart can also efficiently communicate which teachers have a higher performing group of students, even if there are differences by performance level.

New users or users that require a refresher on how to use the reporting system, can access an intuitive user guide that provides step-by-step instructions for every report, information about each measure included in the reporting system, and screenshots to explain how to use the system. The user guide is accessible from any page in the reporting system. The reporting system also has a configurable "Definitions" tab that provides a quick reference for users who want more information about how to interpret a report (for detailed information on the Online Reporting System User Guide, please see Section 7.3.7.5, Interpretive Products).

Test Management Center

The Test Management Center allows users to track test participation in real time to help plan their testing schedules. For example, the reports can be filtered by the percentage of students who have completed a test or whose tests are started but not yet completed. High-level reports are available so that school and district users can see the percentage of students who are completing each performance-based test and ready to take the end-of-year or End-of-Course tests.

Student Search

Sometimes a user just wants an individual student's report and wants it quickly. The student search lets users search by student ID, student name, or any partial student ID or name. The search results provide a list of any students who match that criterion, as well as a table with links to the individual student reports for any tests that student has completed. As always, users can only see students that they have access to, though users can also search students from previous years. This allows a user to see an individual student's results with a minimal number of mouse clicks.

Comparison of AIR Proposal and Current Florida Reports and Data Files

Exhibit 7.5.5-3, on the following pages, summarizes Florida's current data files and PDF reports and identifies the additional capabilities and data that are available through AIR's Online Reporting System (ORS).

Next, we describe the process to produce our online reports along with our quality assurance processes.

Configuration and Design of Online Reports

- Producing real-time, online reports for teachers, schools, and administrators involves the following steps:
- Initial "skinning" of the Online Reporting System to finalize the "look and feel" of all online reports
- Working with the Department to gather requirements and configure the system, including the specific measures and displays to be presented

Conducting Quality Assurance

AIR will work with the Department to ensure that the "look and feel" of the online reports is consistent across assessments and with the Department's paper score reports. Our designers will work with Department staff to select a "skin" for the reporting system composed of colors, logo, headers, and footers that will give each report and data display a unified style.

To ensure that the online reports meet stakeholder needs, AIR will also work closely with

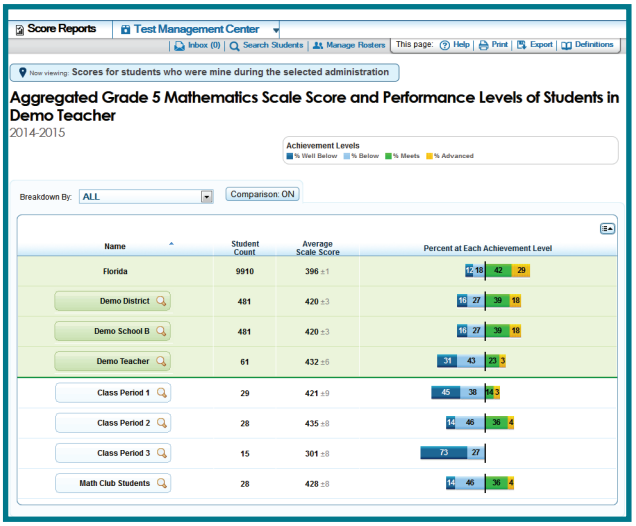
the Department to document requirements and configure the online reports. We will begin by working with the Department to draft a reporting elements document that describes each stakeholder's reporting needs and the available measures that can be used to meet those needs. When the reporting elements document is approved, we will work with the Department to complete the online reporting specifications which define everything in the system, including table layouts, user-role access, definitions, reporting rules, and content hierarchies (for a detailed discussion on reporting specifications, please see Section 7.5.1.). To facilitate this process, we propose conducting an on-site working session with Department staff to capture requirements for each part of the reporting system and complete all specifications. Once the Department approves the specifications, AIR programmers will use these specification documents to configure the Online Reporting System and to conduct numerous quality assurance checks to ensure the system is functioning as required.

Below we provide some sample online reports to demonstrate the kinds of data that educators, schools, and districts will have access to in the Online Reporting System and how these displays can be customized.

Subject Summary Reports

Aggregated subject reports show average performance for the state, schools, teachers, and classes. Bar chart displays show the distribution of students' performance levels. Columns can be sorted on any table in the system to allow for easy comparison, and groups can be disaggregated to report by demographic subgroup (e.g., gender). Exhibit 7.5.5-4 gives a sample subject summary report.

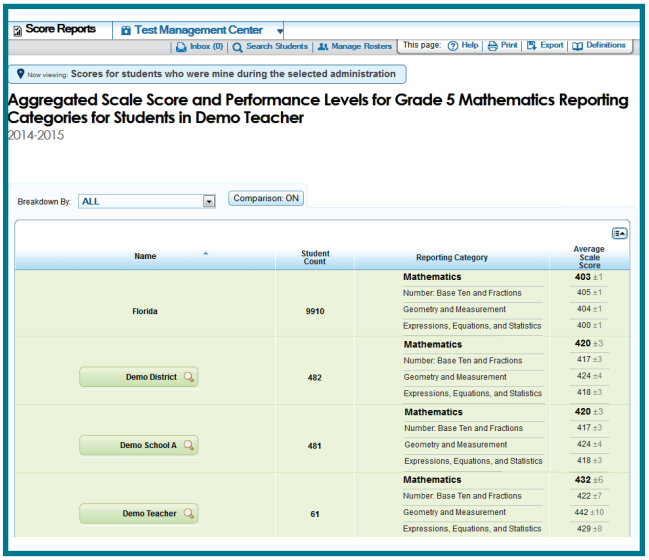
Exhibit 7.5.5-4: Subject Summary Report for a Teacher's Class



Subscore Summary Reports

Aggregated subscore reports follow the layout of the subject summary reports, displaying subscore performance data for the state, districts, schools, teachers, and classes. Exhibit 7.5.5-5 shows a sample subscore summary report for a grade 5 science class.

Exhibit 7.5.5-5: Subscore Summary Report for a Teacher's Class



Benchmark Reports

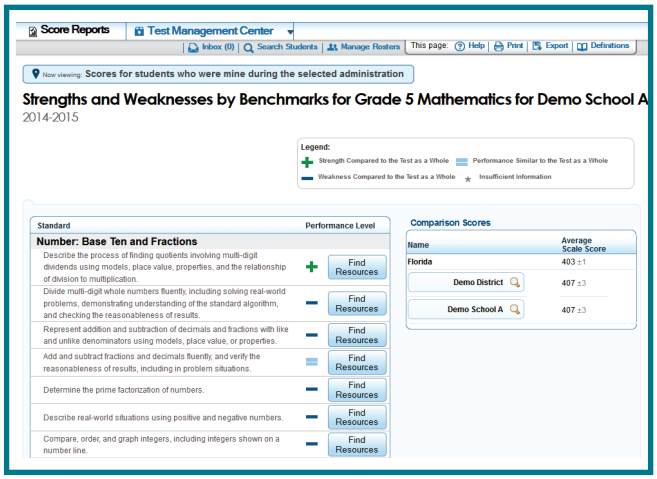
The reporting system leverages the information from the online summative tests to provide diagnostic information for a group of students. Educators want very precise information about the bits and pieces of knowledge or skills that students have or have not mastered. This sort of fine-grained information is actionable; it tells educators what to teach and lets them know where they are succeeding.

If the test design supports these reports (either an adaptive test or a sufficiently large set of operational fixed forms spiraled among students), we can provide detailed reporting at the benchmark level for these assessments. With multiple operational forms, a class of 20 students can respond to a sufficient number of different items measuring any given benchmark. A mechanism for aggregating them that accounts for the differences in student overall proficiency and differences in the difficulty of the items can provide a robust measure of the class, school, or district mastery of that benchmark. Here, we propose just such a measure.

Specifically, we propose to report benchmark information at aggregate levels (e.g., school, class, group of students). We propose that this information be presented in terms of relative strengths and weaknesses so that a teacher sees whether the class performance on a particular benchmark is better than, worse than, or about the same as their performance on the test as a whole. We currently report this information in Delaware, Minnesota, and Oregon for individual benchmarks.

Exhibit 7.5.5-6 shows a sample benchmark report for a class where relative strengths and weaknesses are shown for each benchmark.

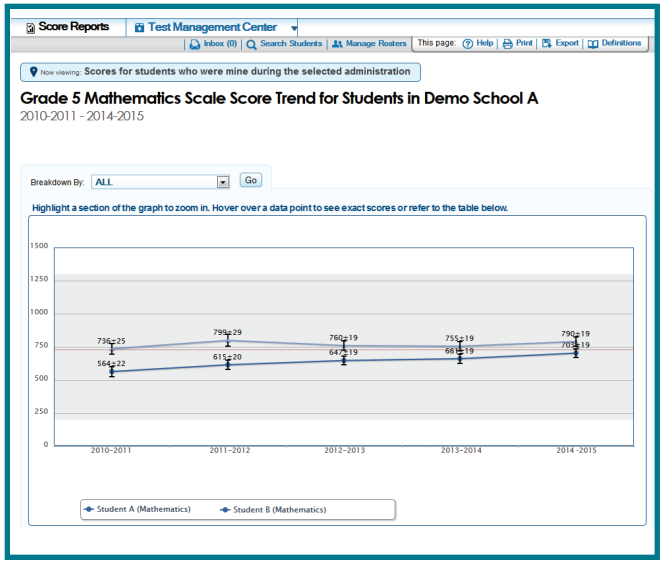
Exhibit 7.5.5-6 Sample Benchmark Report



Trend Reports

Scores for the state, districts, schools, teachers, classes, and students can be plotted on a trend report to illustrate how performance has changed over time. Scores can be plotted across years (e.g., from spring administration to spring administration) and within a year (e.g., from fall administration to spring administration). Multiple trend lines can be plotted at once to see how changes in performance compare between students or groups of students. Subscore trends can also be added to see whether there are differences in performance within a subject. Exhibit 7.5.5-7 shows a sample trend report with two students plotted on it.

Exhibit 7.5.5-7: Trend Report

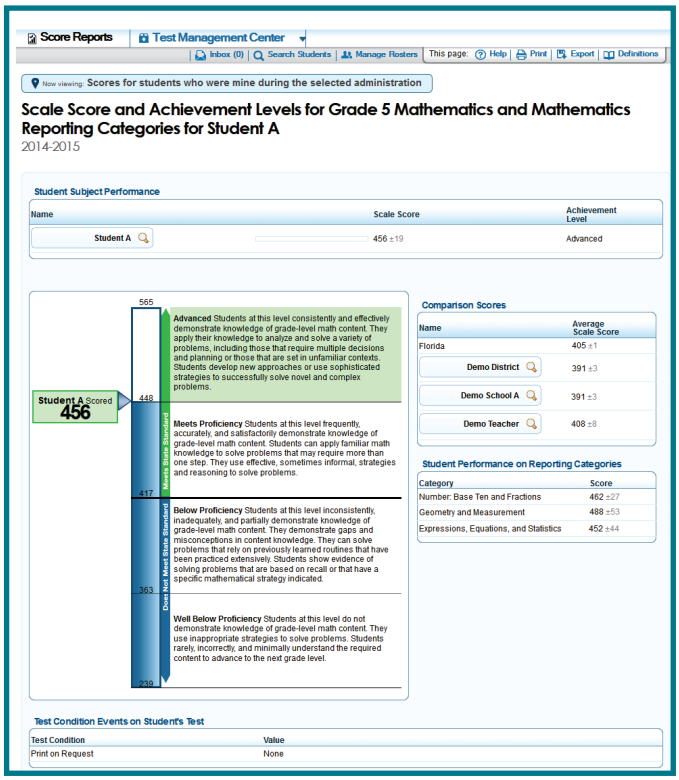


Individual Student Report

Individual student reports summarize a student's performance in an organized, easy-to-understand document that can be distributed to educators, parents, and students. The student's performance is plotted against cut scores on a barrel chart that provides detailed explanations of each performance level. Exhibit 7.5.5-8 shows a sample student report. A student's subscores and comparison data for the state, district, and school are provided in separate tables. The report can be exported as a PDF document, and users can batch print multiple students' reports simultaneously.

The individual student reports can link to student work, such as the student response to a performance task. Here, we propose that such responses be available, and printable, through this interface. We include these in our proposed paper reports as well, but note that the paper report page limits specified in the ITN are not likely to be sufficient to include the student work.

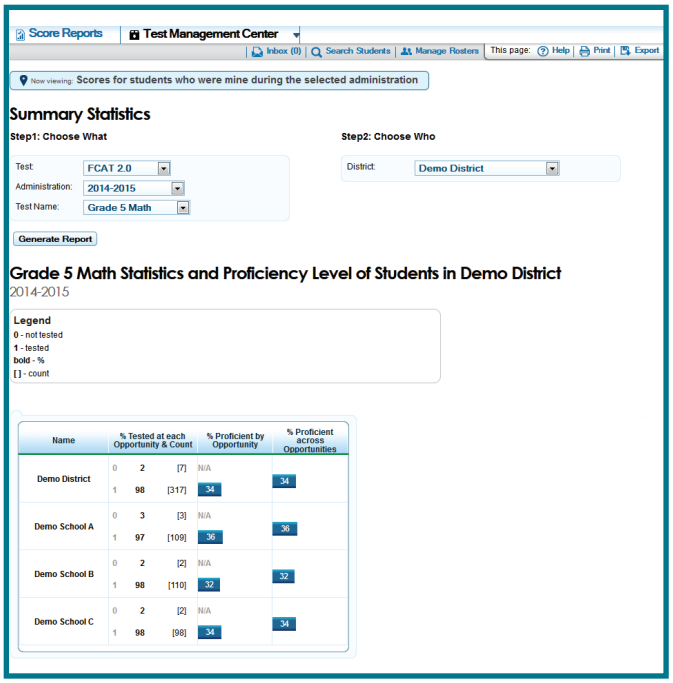
Exhibit 7.5.5-8: Sample Student Report



Participation Reports

Computer-based testing can provide more flexibility to schools in terms of when they administer tests; however, schools still need test participation information to manage their testing schedule, allocate testing resources, and prioritize testing. The reporting system's Test Management Center provides multiple tools to generate up-to-the-minute reports showing students' test status. Users can set testing schedules, monitor testing progress across schools and even track students' participation based on their performance on previous tests. Exhibit 7.5.5-9 is a sample of the summary statistics report from the Test Management Center. This report provides a high-level view of how many students have completed each test opportunity and the percentage of students proficient by opportunity and overall.

Exhibit 7.5.5-9: Participation Report with High-Level Summary Statistics



AIR's Paper Reports

In addition to providing online reports for Florida educators, schools, and districts, AIR commits to developing and distributing customized, full-color score reports for families and students for all assessments outlined in the ITN. Should the Department decide not to use AIR's Online Reporting System to deliver score data to educators, schools, and districts, AIR will also develop separate PDF reports for schools and districts using the same paper report development process outlined below.

AIR has successfully delivered millions of pages of error-free, enhanced paper score reports to families, educators, and administrators across the country. Using state-of-the-art variable programming technology, our full-color paper reports provide clear, customized text recommendations to help families, teachers, and administrators focus on the actions that can help their students succeed. In developing new reports for Florida families and students, we propose to enhance the design of Florida's current student reports by

- using full color to aid readers' interpretation of the data;
- including substantive, customized text recommendations to guide parents and students in their understanding of student scores and next steps;
- including longitudinal data from up to seven administrations; and
- including comparison data from international and other assessments to help students gauge their relative performance.

In addition, we propose that the student reports contain the following data elements as outlined in Section 7.5.5 of the ITN:

- Scale scores, achievement levels, raw subscores, passing status, points possible, and comparison data (state means)
- The student's actual response for one released performance task along with the number of points earned on the item, descriptive information about the question, and the points earned on all of the performance items

We note that the length specified in the ITN for the paper reports will likely be insufficient to include the student performance task responses. To provide a compatible bid, we have not expanded the report length, and our base bid includes the online delivery of the student performance task responses.

We will also work with the Department to identify sections of the student report that must be translated into Spanish and Haitian Creole. If required, we will provide two copies of the student report to districts (one to be mailed to families and the other to be added to the student's official file). Alternatively, if the Department decides to use AIR's Online Reporting System, schools and districts can

batch print PDFs of the student report directly from the system. For a detailed list of paper reports that AIR proposes to develop along with the frequency of report distribution for each assessment, please refer to Exhibit 7.5.5-11. Below we describe AIR's paper report development process.

AIR's Paper Report Development Process

Developing fully customized family paper reports involve the following steps:

- Designing full-color mock-ups
- Completing specifications
- Developing data-driven text recommendations
- Conducting quality assurance
- Printing, packaging, and distributing the reports

Designing Enhanced Color Paper Score Reports

The initial design phase for paper reports begins with the consideration of the inferences, actions, and choices that the data should encourage and then works backward to the inferences that will lead to these actions, the data displays that will guide readers to the appropriate inferences, and the data and measures to be displayed. AIR's reporting team will work closely with the Department to identify the actions or behavior the Department would like to encourage among parents and students and the data measures and interpretive measures that can help bring about these actions. For example, if the goal is to increase discussion between parents and teachers about the new standards, then the reports should include plain language terminology describing the standards that is accessible to parents. All data measures and interpretive elements are captured in the data elements document. Once the data elements document is approved by the Department, AIR's designers begin designing report mock-ups that include each of the approved elements.

AIR's talented design team includes eight full-time designers who are responsible for designing both paper and online reports. Exhibit 7.5.5-10 presents the qualifications of some of the graphic designers we can deploy on this Florida project. Resumes are included in Appendix A. Given that AIR's paper reporting

Exhibit 7.5.5-10: AIR Graphic Designers and Qualifications

Name/Title	Degree/Experience	Relevant Assessment Experience
Daniel Schwartz *Senior Designer*	M.F.A., Computer Design B.A., Fine Art: Visual Communication 14 years of experience; 8 at AIR	Lead Designer for the Test Delivery System (TDS)
Julie Tucker *Senior Designer*	B.A., Writing Seminars; Film & Media Studies 15 years of experience; 9 at AIR	Leads front end development and UI design for AIR student registration, reporting and other user facing systems. Led development of design and graphics for AIR variable data printed score reports.
Eli Mintzer *Junior Graphic Design Editor*	B.F.A., Art and Visual Technology 5 years of experience; 1 at AIR	Creates mock-ups, assets, and materials for student paper reports using Adobe InDesign, Illustrator, and Photoshop
Adam Clegg *Junior Designer*	B.A., Professional Writing 8 years experience in web design; 2 at AIR	Responsible for designing interface changes to web projects, developing design solutions in HTML/CSS, fixing CSS issues that occur in projects, developing design mockups, ensuring code produces compatible designs in most major web browsers

capability offers unparalleled customizability (any text, shape, color, or data display on any part of the page), we have virtually infinite flexibility in designing the paper reports. The design process involves our graphic designers producing numerous iterations of the mock-ups and working closely with the Department to ensure that their feedback is reflected in subsequent iterations. All final colors, designs, and specifications will be determined and approved by the Department.

Once mock-ups are approved by the Department, the next step is to finalize the reporting specifications document (for a detailed description of this document, please see Section 7.5.1). All the data displayed on paper reports or online reports will conform to the analysis specifications agreed upon between the Department and AIR psychometricians and statisticians. These calculation rules will be documented in a reporting specifications document and approved by the Department.

Using Color as Interpretive Aid

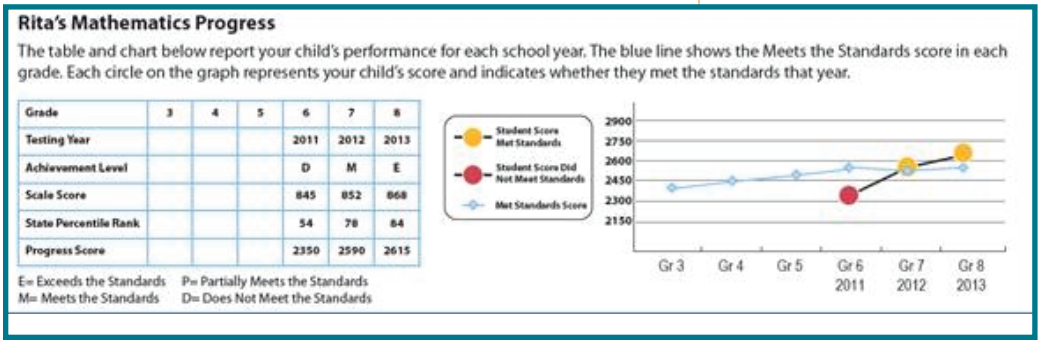
One of the most important design enhancements we propose to Florida's current student reports is using color as a positional queue and interpretive aid. Substantial cognitive research suggests that appropriate use of color can facilitate accurate interpretations of statistical graphics in ways that black-and-white graphics cannot (Cohen & Cohen, 2006). We start by noting that people can absorb some information without any conscious attention at all. Cognitive scientists distinguish perceptions that are processed "preattentively," or without cognitive effort, from those that require effort and "focused attention" (Allport, Tipper, & Chmiel, 1985; Neisser, 1966; Treisman & Sato, 1990). Preattentive processing happens "naturally" without any cognitive effort.

The correct use of color can lead readers to compare information that should be compared and make inferences that should be made. Research demonstrates that the human eye perceives differences in color as boundaries between objects, and preattentively groups objects of the same color together (Callaghan, 1984, 1989; Kubovy & Cohen, 1991, 1992; Treisman & Sato, 1990).

Statistical graphics can signal the reader preattentively to compare objects (such as bars in a bar chart) by making them the same color. For example, side-by-side graphs of the percentage of students in each proficiency category for the state and district can lead most readers to compare the district and state percent proficient simply by making the proficient sections the same color in the two graphs (see Exhibit 7.5.5-11 for an example).

AIR's full-color process provides complete freedom in report design, enabling us to use color to facilitate appropriate inferences and encourage readers to make connections preattentive-

Exhibit 7.5.5-11: Longitudinal Table of Reading Scores



ly. AIR's process goes well beyond the industry standard, resulting in much more easily interpretable (and therefore more valid) reports, as well as reports that are more attractive. The "industry standard" process for enhanced reporting begins with preprinted forms, in which all the color that will appear on a report appears in fixed locations and configurations. The only variable information printed on a report is printed in black ink. While this limited use of color may enhance the attractiveness of a report, it does not serve to aid the reader's interpretation of data.

Substantive Text Recommendations for Parents

We also propose to enhance the design of Florida's current student reports by including plain-language text for students and parents that explain the content standards assessed on each test and what students in each of the reporting levels typically know and can do. We further suggest including advice about some next steps the parents and students might take at home to practice skills needed to master the standards. Students performing in different score ranges receive advice appropriate to those score ranges. Written in parent-friendly language, this data-driven text provides a substantive explanation of what parents should understand from the data and what they can do as a result of the data.

Interpretations, recommendations, and other texts are drafted by content specialists or statisticians. Data-driven text appearing on the paper reports will be developed within the Item Tracking System (ITS), reviewed by content experts and editors, and submitted to the Department for review and approval. For examples of our enhanced family reports that contain customized recommendations for parents, please see Appendix G.

At the same time that text is being developed, the paper report development process uses graphical programming, which takes place in a Xerox-developed programming language called VIPP and allows virtually infinite control of the visual appearance of the reports. After designers at AIR create backgrounds, our VIPP programmers write code that indicates where to place all variable information (data and text) on the reports. Programmed output goes through multiple stages of review and revision by graphics editors and the Score Reporting team to ensure that design elements are accurately reproduced and data are correctly displayed. As with each component of this process, the VIPP programs go through rigorous quality control reviews.

Longitudinal Reporting

AIR proposes to report longitudinal student performance for parents and students along with any significant trends evidenced by the data. This will allow parents to detect patterns of potential weakness in students at an early stage and can aid in more precise intervention to help remedy students' weaknesses. In the section on online reporting above, we describe the capability to include longitudinal scores for teachers, schools, and districts. Exhibit 7.5.5-11 gives an example of the longitudinal data display that we currently provide to Minnesota parents and students:

Quality Assurance

Statistical Programming

The family reports we propose to develop for Florida contain custom programming and require rigorous quality assurance processes to ensure their accuracy. All custom programming is guided by detailed and precise specifications in our reporting specifications document (see Section 7.5.1 for more detail). Upon approval of the specifications, analytic rules

are programmed and each program is extensively tested on test decks and real data from other programs. The final programs are reviewed by two senior statisticians and one senior programmer to ensure that they implement agreed-upon procedures. Custom programming is implemented independently by two statistical programming teams working from the specifications. Only when the output from both teams matches exactly are the scripts released for production. Quality control, however, does not stop there.

Much of the statistical processing is repeated, and AIR has implemented a structured software development process to ensure that the repeated tasks are implemented correctly and identically each time. We write small programs (called macros) that take specified data as input and produce data sets containing derived variables as output. Approximately 30 such macros reside in our library for the grades 3–8 program score reports. Each macro is extensively tested and stored in a central development server. Once a macro is tested and stored, changes to the macro must be approved by the Director of Score Reporting and the Director of Psychometrics, as well as by the project directors for affected projects. Each change is followed by a complete retesting with the entire collection of scenarios on which the macro was originally tested.

The main statistical program is mostly made up of calls to various macros, including macros that read in and verify the data and conversion tables and the macros that do the many complex calculations. This program is developed and tested using artificial data generated to test both typical and extreme cases. In addition, the program goes through a rigorous code review by a senior statistician.

Display Programming

The VIPP code that places the variable text, graphic displays, and other variable data is tested using both artificial and real data. AIR's data generation utilities can read the output layout specifications and generate artificial data for direct input into the VIPP programs. This allows the testing of these programs to begin before the statistical programming is complete. In later stages, artificial data are generated according to the input layout and run through the psychometric process and the score reporting statistical programs, and the output is formatted as VIPP input. This enables us to test the entire system.

Once we receive final data and VIPP programs, the AIR Score Reporting team will review proofs that contain actual data based on quality assurance documentation that is provided by the Department. In addition, we will compare data independently calculated by AIR psychometricians with data on the reports. A large sample of each type of report will be reviewed by several AIR staff members to make sure that all data are correctly placed on reports. This rigorous review typically is conducted over several days and takes place in a secure location in the AIR building. All reports containing actual data are stored in a locked storage area. Staff from the Department are welcome to visit AIR at any point during this revision process to oversee our procedures. Prior to printing the reports, AIR will provide a live data file and reports with sample districts as chosen by the Department for the Department's review. AIR will work closely with the Department to resolve questions and correct any problems. The reports will not be delivered unless the Department approves the sample reports and data file.

Printing, Packaging, and Distribution

Paper reports for each testing program will be distributed according to Department specifications. For example, EOC paper reports will be distributed in summer, fall, winter, and spring, whereas ELA/L and Mathematics reports are distributed annually. Once all tests are scored, AIR will produce data files and print and ship reports for all students who tested during the school year.

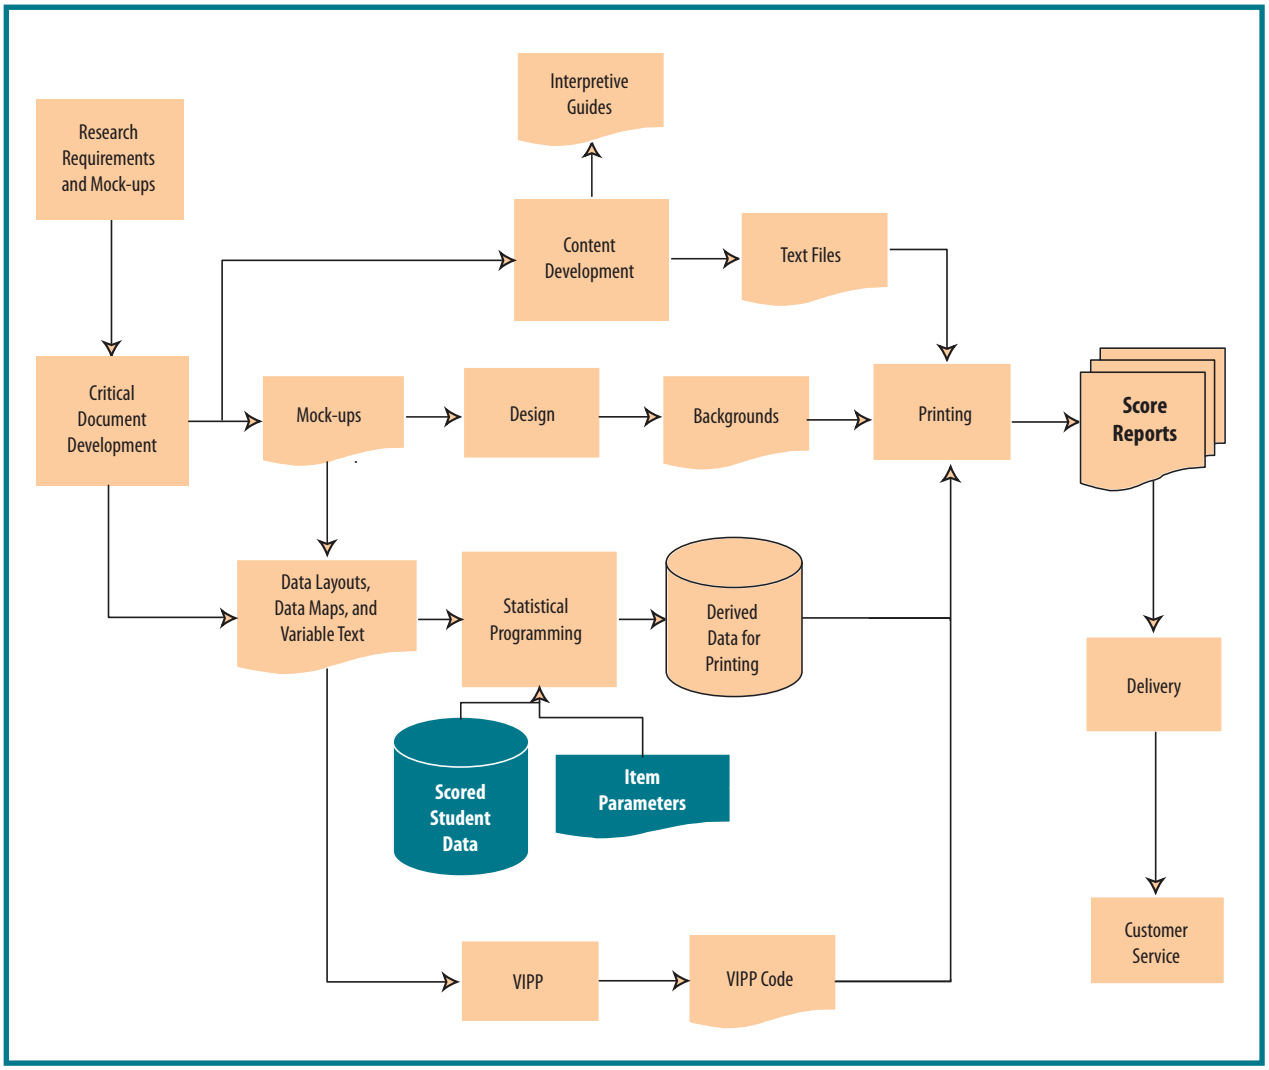
AIR works with an established network of print vendors around the country that are thoroughly trained on our report printing specifications. Our print vendors are ISO certified, provide fully secure print facilities, and are capable of printing and packaging high volumes of full-color reports in exceedingly compressed timelines.

Our score reports use cutting-edge digital print technology. While individual reports can be printed to a postscript or PDF file, the real power of VIPP is to directly drive the printer, dramatically speeding up the printing process and enabling us to make full use of the speed and power of full-color Xerox iGen printers. These machines merge the graphic program code (VIPP code) with data at print time, drastically reducing the total time needed to print reports. Printers are able to handle millions of pages and dynamic color, ensuring that there will be no late deliveries. During printing, reports are checked for color against color samples, and print site auditors review reports as they are printed to make sure that graphics are printing properly, all pages are correctly printed, and there are no printing errors such as ink smudging or faulty lines.

Our additional quality control procedures during printing including the following:

- When the reports are printed, a consecutive number is applied in the gutter of the page of every report. The number consists of the district code and consecutive report number (i.e., 34567-12). This number is placed on each report in case the reports are shuffled out of order. This sequence number allows print site staff to place the reports back into the correct order before packaging.
- All reports that need to be folded and stitched together are controlled by the VIPP code, which tells the booklet maker on the iGen when and when not to fold and stitch the job, as well as how to impose the pages, thus eliminating the possibility of manual error.
- All reports that require folding or stitching are produced with an automatic inline stitcher on the iGen, eliminating the possibility of manual errors.
- To ensure accurate packaging, the VIPP code programs divider sheets to appear between classes, schools, and districts. Divider sheets are printed on one 11”×17” page custom label stock paper that moves through the booklet maker. The dividers contain information about the reports between the current and the next divider sheet including the type of reports/student labels that will be placed in the package, the contact name to whom the reports will ship (if applicable), the name and number of the district, the name and number of the school (if applicable), the address to which the reports will ultimately be delivered, the package number out of the total number of packages in the file, and the first and last serial number of the reports.
- Detailed instructions on how to package reports for special schools such as home schools, virtual schools, non-public hierarchies, and community schools are provided to all vendors. Divider sheets convey to packagers exactly how these reports need to be packaged and shipped.

Exhibit 7.5.5-12: Process Flow for Paper Score Reports



Divider sheets also contain a removable label that packagers place on the inside package containing the reports.

AIR will provide documentation of established quality checks upon request.

AIR's PrintTracker program manages the printing and shipping process. PrintTracker, a web-enabled logistics program, assigns work units to printers on a flow basis, ensuring that all printers remain busy by routing work to each printer when the previous batch is complete. PrintTracker has multiple, built-in quality assurance features to ensure that reports are correctly packaged and shipped. For example, an operator at a print site must record the number of packages and boxes destined for each school or district. PrintTracker confirms this number against the database before indicating to the operator that the package may be sealed and allowing him or her to print shipping labels. Any discrepancies are reported to and resolved by AIR print management staff to ensure that every report is shipped to the correct location.

The flow chart in Exhibit 7.5.5-12 summarizes the process by which we propose to develop the enhanced paper score reports for Florida.

7.5.5.1 Initial Reporting Guidelines

Introduction

A fundamental purpose of Florida's standards-based assessment program is to provide accurate information on student achievement. This requires following rigorous data checking procedures to ensure that score results are provided to the right student in the right school at the right district. Data cleaning procedures are typically used to verify three categories of information:

- Student, School, and District associations;
- Student, School and District identifiers; and
- Student demographic and enrollment information.

Up until recently, Departments of Education have invested significant time and budget resources to scrutinize and correct their student, school, and district data *after* testing is complete and before publicly releasing score results. Much of this has been unavoidable because of the time lag between preID and testing, a period during which many students change schools or enter the system. These students' identifying information has been hand-gridded onto their answer documents—a process that inevitably introduces errors.

With the introduction of online testing, much of the possibility for error has been taken out of the preID process. Students must be known to the system *before* testing. Continuous registration processes eliminate the need for much of the post-testing cleanup.

AIR and DRC offer a process that brings the efficiency of continuous registration to paper testing, extending the benefits in terms of data quality and reduced cleanup time at the end. Late arriving students can be added to the system at any time, and schools or districts can print "real-time-ID" labels using any laser printer on label stock that we will provide. There will be no need to "bubble" student information onto the cover of an answer document, and the identifying information can be corrected by school or district personnel at any time during the testing window.

AIR's student registration system (our Test Information Distribution Engine, or TIDE) and the Roster Tracking System (RTS) have made it possible for districts to verify and update school and student information throughout the school year—before, during and after testing—allowing Departments of Education to realize numerous efficiencies including

- far greater reliability of school, district, and demographic data resulting in more accurate distribution of online and paper reports;
- a reduction in the total volume of records requiring cleanup or reconciliations at the end of testing; and
- speedier production of score reports despite exceptionally compressed timelines.

Below we outline the challenges that many Departments of Education face as well as our proposed solution for ensuring data integrity through a series of comprehensive, continuous data verification processes.

The Challenge

When testing large volumes of students, discrepancies in student-school associations, student demographic information, and enrollment and information are bound to arise. For example, school and district identifiers often change for a number of reasons. Due to the numerous types of special schools in Florida (home schools and virtual schools) and volume of stu-

dents testing in schools that are different from the schools where their scores must be reported, school numbers often require updating after scanning. Programs with paper testing pose even more challenges. The bubbling process ensures that the data cleanup required will be extensive, because hand-gridding the demographic information is tedious, labor intensive, and error prone.

Our experience working with Departments of Education across the country has revealed that there can also be problems with unique student identifiers. Despite multiple checks, it can and does happen that a student identifier has been assigned to more than one student in the same district, causing issues when matching demographic information to test scores. Other scenarios that we've encountered and that require adjusting student or school data include the opening, merging, or closing of new schools (this requires modifying school district associations) and a host of test irregularities that include student cheating or interruptions to testing due to fire alarms, etc.

Conventional processes require that all these kinds of errors be individually resolved and only *after* scanning is complete and the score data become available. As a result, Florida's current process of cleaning up student, school, and district information and redirecting reports to the correct school takes weeks, delaying the production of final reports.

Our Solution

The solution we propose uses our integrated online systems to provide districts with a series of continuous, comprehensive checks to verify their data throughout the year. The first series of data verification checks are conducted before or during testing and allow districts to do all the following:

1. Review and revise student, school, district information using TIDE (TIDE contains student-school relationship data, school identifiers, as well as demographic and enrollment information, all of which can be reviewed).
2. Use our real-time ID service to print preID labels for students testing on paper one or two days before testing, reducing the possibility of erroneous hand-gridded demographic information.
3. Respond immediately to test irregularities during the test window instead of after scanning.

In addition, we propose the following data cleaning measures after testing is complete to resolve any remaining data issues:

- An automated discrepancy process that flags for resolution by the Department any remaining discrepant records after testing
- Extension of the data verification window beyond testing, at the Department's discretion
- An opportunity for Department staff to access the Online Reporting System to verify all data before public release, or before the results are considered "official"

One of the Department's concerns as stated in the ITN, is the ability of reporting and psychometric staff to conduct all spring reporting activities while also turning their attention to updating the reporting specifications for the next year. By moving up critical data cleaning activities to much earlier in the process, reporting activities are protected from unnecessary additional time pressure, allowing reporting and psychometric staff more time to produce spring reports, conduct regression testing, and update reporting specification for the upcoming year.

Next we provide a detailed description of how TIDE allows districts to revise their student, school, or district data before and during the test window.

Real-Time Opportunities for Districts to Check and Revise School and Student Information in TIDE

As described above, the Department requires data verification and cleanup measures before reports are released, to address situations where districts or schools do not indicate all the appropriate school relationships. In most online testing programs, data verification of student and school information happens before testing begins. That is, students must be authenticated before they test. For example, if a student does not have a valid student ID, he or she will not be able to access any online tests until this is corrected in TIDE through a file upload or through the user interface. Online testing requires processes where students are positively and properly identified before testing. As a result, fewer demographic and relationship discrepancies exist when conducting tests online than in a conventional paper-and-pencil testing situation.

The data verification activities mentioned above are conducted via AIR's Test Information Distribution Engine (TIDE), which provides an integrated system for collecting and adjusting data about students including student relationships (to their districts, schools, teachers, and classes), demographics, and accommodations. For a detailed discussion about TIDE please see Section 7.4.8. In online assessment programs, we typically open the TIDE window well before testing, and leave it open beyond the testing window. Throughout the testing window, TIDE offers the ability to check and revise student demographics, student-school associations, reporting schools and other information that may change or require correction. Districts can view the student information directly through TIDE, and can implement corrections either through file uploads or through the interactive user interface.

For example, during the test window, a district may need to accommodate a new student who is enrolled in one school, but attends an alternative school. In this case, both pieces of information (the student's enrolled school and the school at which the student tested) would have to be entered into TIDE, either through a file upload or through an interactive interface.

The seamless integration between our Online Reporting System and student registration system ensures that all updated information in TIDE will be used to produce reports and data files. The information active in TIDE after a pre-established date will be merged with the score data prior to reporting, eliminating the need to conduct downstream data verification steps after testing is complete. As an additional check, during the testing window, schools or districts can confirm the reports they can expect to receive. If adjustments need to be made, they can add or correct the necessary data directly in the TIDE system and the appropriate reports will be provided.

Reducing Data Discrepancies through Real-Time PreID

The ITN notes that corrections to school names and identifiers are often required following scanning. Much of this sort of cleanup is needed as the result of gridding errors on paper test booklets, which our proposed Real-time ID process eliminates. (See Section 7.4.8 for a detailed discussion of Real-time ID.)

Real-time ID will allow Florida schools and districts to register students as little as one or two days in advance of testing for *both online and paper* testing to accommodate newly entering students. For paper tests, schools will be able to print an individualized, barcoded, student-

specific "preID" label instead of bubbling information on a form. The scannable labels can be printed using any laser printer on label stock to be delivered with the preID'd answer booklets. Real-time ID solves the problem of invalid school names and IDs by preventing their introduction in the first place. Our proposed Real-time ID service also improves data integrity by ensuring that most of the data cleanup can be completed online before the testing window even closes, allowing reporting activities to begin much earlier than under Florida's current system.

Opportunities for Districts to Address Test Irregularities during Test Window

TIDE also supports a series of tools that districts or other authorized users can access to immediately address test irregularities, including invalidating and resetting student tests. The term irregularity covers many different types of events including cheating, fire alarms, or other emergencies at a school that may stop testing for the day. Despite multi-layered, redundant identity checks, students sometimes test under another student's identifier, or individual students may test under multiple identifiers. Test administrators may misadminister an assessment, students may fall ill during testing. In a large state like Florida, almost any anomalous situation that can be imagined will likely happen at some point.

AIR has developed a suite of tools to enable districts to take immediate corrective actions to address testing irregularities. These tools include the following:

- *Invalidations,* which involve invalidating a student's test so the student cannot resume testing. In this case, the specific test opportunity has been used. State Departments of Education typically only allow invalidations in rare cases.
- *Resets* require a student's test to be restarted from the beginning as if the student never tested. In this situation, the opportunity is preserved by re-setting the test.
- *Extensions* involve an extension of the pause rule on the student's test. The extension allows the student to resume his or her existing test where the student left off. Specific extensions include
  - *Extension of the Expiration Date*: the student resumes where he or she left off but cannot go back to previously answered items. This is used if the opportunity to resume has expired (and is implemented by extending the expiration date).
  - *Grace Period Extensions*: the student resumes where he or she left off but he or she can also navigate back to questions within the section as needed. This option is implemented by suspending the pause rule.
  - *Grace Period Extension with Segment Permeability*: the student resumes where he or she left off but is permitted back into previous sections of the test to review answers. This type of extension exposes all items within the permitted segments.

As districts or authorized users enter their invalidation, extension, or reset requests in TIDE, their decisions are immediately reflected in the Online Testing System and the Online Reporting System (ORS), significantly reducing the need for post-test data cleaning. For example, if a student's test is invalidated, the results of that test will automatically be withheld from appearing in the Online Reporting System. No manual removal of the record is required from either the downloadable data files in the ORS or the Online Reports. The ability of districts to address test irregularities during the test window further

reduces the number of outstanding data issues that need to be resolved after testing, allowing reporting activities to begin much earlier.

Automatic Identification and Resolution of Discrepant Records

While Real-time ID will virtually eliminate the existence of data discrepancies in paper testing, it is possible that a very few tests might still fail validation in the Test Integration System or the QA system. Possible reasons for validation failure include duplicate identifiers, schools that have closed, or other unusual circumstances.

In these cases, we propose to work with the Department to establish a discrepancy identification and resolution process to correct the data quickly and efficiently. In online testing programs, the discrepancy process typically works as follows: AIR delivers a file to the Department at pre-established intervals (nightly or weekly) with all records that encountered an error in the validation process. (We will work with the Department to establish all validation rules.)

- The file includes the student data that was bubbled on the demographic page, in addition to data from our Roster Tracking System (RTS), provided the student appears in the RTS.
- The file will conform to a pre-established layout approved by the Department, pre-approved naming conventions, and will be delivered to an agreed-upon location.
- Scanned demographic pages can be included in a separate zip file named with the timestamp when it was generated.

To resolve identified discrepancies, we propose that the Department deliver a file back to AIR at pre-set intervals (nightly or weekly) with corrections to the test records that failed validation in AIR's systems.

- The file will contain agreed-upon variables such as Book ID, and student identifier.
- The file will conform to the agreed-upon layout, delivered to an agreed-upon location, and use an agreed-upon naming convention.

The automated discrepancy identification and resolution process described above ensures that the few remaining data discrepancies do not delay reporting activities. Student results for records with accurate demographic and SSID information will appear in the online system automatically. Scores for resolved discrepant records will appear in the Online Reporting System and the downloadable data files the day following our receipt of the Department's correction file.

Real-time ID, continuous registration and cleanup, and automation of the identification and resolution of discrepancies eliminate weeks from the process, ensuring that reports are produced earlier and use more reliable data.

Post-Test Data Verification Window

Our proposed solution for ensuring accurate data to produce the initial wave of reports includes a continuous cleanup period. Cleanup can be accomplished during the testing window; however, the cleanup window can extend beyond the testing window at the Department's discretion. We will work with the Department to identify the dates for the verification window. During this window, districts will have the opportunity to view and revise the following information in TIDE:

- Student demographic and enrollment information;

- School and district information;
- Student, class, school, and district relationship information; and
- Information on test invalidations and extensions.

During the verification window, districts may make any required corrections to the above information in TIDE (or through the state SIS to be delivered to TIDE). For example, if additional test invalidations need to be implemented during this period, districts can enter these directly into TIDE. We propose that the timing of the cleanup period coincide with the dates that the Department conducts its review of the draft data file and calibration file.

The seamless integration between our student registration system and the Online Reporting System ensures that all updated information in TIDE will be used to produce reports and data files. The information active in TIDE after the close of the post-test verification window, will be merged with the score data prior to reporting, eliminating the need to conduct extensive data cleanup steps after the window closes. As an additional check, during the verification window schools and districts can confirm the reports they can expect to receive. If adjustments need to be made, they can add or correct the necessary data directly in the TIDE system and the appropriate reports will be provided.

Department Verification of Data before Reports Released

After the post-test data verification window closes and before results are publicly released, we propose the Department review and verify all student level and aggregate data in the Online Reporting System.

The Department will receive data files and sole access to the Online Reporting System. We recognize that in the past the Department has required multiple releases of the final data file before it was correct. We have included this in our schedule, but believe that you will find initial deliveries to be complete and correct. The continuous cleanup and quality monitoring help eliminate many of the traditional challenges that accompany paper testing.

We will work with the Department to identify dates during which Department staff alone can access and verify results in the reporting system. During this period, the Department will be able to confirm all school and district information, student and school associations, demographic, and enrollment information, as well as test invalidations. Should there be additional data discrepancies that need to be resolved, the Department can provide an updated data file to be loaded directly into TIDE.

In addition, we will work with the Department to identify a sample of reports for the Department's QC as outlined in the ITN. After the Department's approval of final results, we will deploy the Online Reporting System so that all schools and districts can access their reports and data files. Upon the Department's approval, we will also print paper family reports to arrive in districts on the scheduled date in Florida's critical dates calendar.

7.5.5.2 Late Reporting Guidelines

We expect that the volume of late reports will decrease as more schools move to online testing and the data cleaning measures described above greatly reduce the number of reports sent to the wrong school. However, for the late records that do exist, these will flow automatically to the Online Reporting System as handscoring is completed and the scores have passed all the data validation checks described in Section 7.5.5. As late batch results flow to the Online Reporting System, these records

will also be included in the downloadable data files for schools and districts to generate on demand. We propose that, like the initial wave of reporting results, late student results remain in the Online Reporting System until the Department approves their release.

To facilitate the Department's review of late batch results, we propose to follow the same data cleaning processes described above for the initial wave of reports. Districts will have an opportunity to view student, school, and district information in TIDE during the post-test verification window and before the production of late reports. Similarly, we propose the Department review and verify school, district, and student information in the Online Reporting System before approving the release of late results. Our experience in other states has proven that our data cleaning processes enable timelier production of late batch reports, especially for graduating students who require their results quickly.

In summary, we commit to providing three waves of late batch reporting for each administration and including the following reports and data files:

- Two hard copies of Late Batch Student reports for each wave of late batch reports. These reports will include a date on the front page indicating they are late batch reports and will be produced using the same paper reporting process we outline in 7.5.5. (If districts and schools require hard copy reports immediately, they can print their own student reports directly from the Online Reporting System.)
- Downloadable data files containing the District Student Results and the School Student Results. These files will contain all late batch records and will be available immediately in the Online Reporting System, eliminating the need for districts to wait for CD shipments.

Searching For Missing Answer Documents

To address district inquiries about missing reports or requests to review student scores, AIR's partner DRC will search for missing answer documents as required.

All missing document search requests will be submitted to the Department via the Score Inquiry System after initial release of the data. After Department approval is received, DRC staff will initiate and track the search process. DRC will follow a series of steps designed to conduct the most effective search possible:

- During the first step, DRC's document processing team will be requested to identify the batch with which the document would have been processed. Using this batch information and DRC's document records, a determination will be made whether the document was scanned, pulled, or missed for a particular reason or was never sent to document processing.
- If a review of processing records does not locate the missing document, all test booklets/answer documents received from the associated district/school will be retrieved from secure storage and thoroughly searched to locate the missing materials. DRC will also search any not-to-be scored materials in case the document was incorrectly labeled or packaged for return.
- As a final attempt to locate the missing document, DRC will contact the district test administrator to verify that all materials were sent back to DRC. DRC will utilize its Missing Score/Document Investigation Form, which is designed to gather information to assist both DRC and district/school personnel with locating the missing document. DRC will confirm that the number of boxes returned to DRC matches the number of boxes received. DRC will also verify the number of answer documents returned

from the district/school. If district/school personnel are able to locate the missing document, DRC will arrange for it to be sent back to DRC for processing, scanning, and scoring for inclusion in the late reporting process.

7.5.5.3 Close-Out and Annual Reporting Guidelines

After the last wave of late batch reports is produced, AIR will produce final end-of-year files for the Department that contain the final records for all students. We will work with the Department to establish a delivery date for these files.

Our process proposed above for resolving data discrepancies means that the corrected student records will automatically appear in the Online Reporting System without the need for any manual cleanup processes.

We also note that at any point, the ORS aggregate and roster reports are up-to-date in the Online Reporting System and can be generated by districts and schools on demand. These files will contain the same information as the current the Student Aggregated Results file (SAR) and the District Aggregated Results file (DAR).

Allowing districts to view and revise school, district, and student data throughout the year means greater data accuracy before initial and late reports are produced. This in turn results in our ability to generate end-of-year data files for the Department which require far less data cleanup than under Florida's current system. We commit to providing the Department with

- a data extract after all late reports for the year have been produced that includes the final records for all students taking the EOC assessments or ELA/L or Mathematics assessments; and
- concatenated EOC results files that contain all four administrations of student data.

The above files will include only corrected records (all erroneous or discrepant records will have been removed prior to the generation of this file).

7.5.5.4 Demographic Reporting Guidelines

In the sections above, we describe our proposed solution for ensuring that districts can review and revise their demographic information in TIDE before, during, and after the test window. This ensures that all paper and online reports, as well as downloadable data files, contain up-to-the-minute demographic information. Based on this solution, we expect to produce online and paper reports powered by real-time demographic information, eliminating the need for producing separate demographic files later in the year.

To meet the Department's need to populate its interactive demographic databases, we propose to provide the Department with a data extract from the Online Reporting System that contains the districts' most updated demographic information. This file will contain disaggregated data for approximately fifty sub-groups as required by the ITN. We will work with the Department to finalize a layout for this file that is compatible with the Department's demographic websites as well as a delivery date for this file.

Alternatively, if the Department decides not to use AIR's online system for distributing school and district results, we can provide data files that are based on the Survey 3 demographic data as outlined in the ITN. As in our first option above, disaggregated results can be automatically generated and reported in the ORS.

7.5.6 Verifying Data

Whether the Department continues to employ a post-equating approach to scoring and reporting summative assessments or elects to adopt a pre-equating approach that will support immediate scoring and reporting, there are a range of scoring and reporting processes that must be verified both in preparation for test deployment and psychometric analyses, and throughout the scoring and reporting process.

Because the Department will be supporting a dual-mode system, a range of mock or simulated data will be used to verify the accuracy of all processes. Some simulated data is mode-specific. For example, to prepare for processing of paper-based assessments, DRC develops test decks to calibrate and verify accuracy of imaging equipment and data file uploads to AIR. Test decks are designed to assess the range of processing requirements, including ensuring that scanner settings accurately implement detection thresholds, including absolute thresholds for the detection of marks, and relative thresholds for distinguishing relative intensity between multiple marks.

Similarly, prior to launching online assessments, AIR conducts user acceptance testing (UAT), which allows the Department and AIR to verify the accuracy of data capture in the online system. AIR develops a set of "test decks" that are designed to evaluate accuracy of data capture in a manner quite similar to the test decks used to calibrate imaging equipment. Test records are generated to simulate a variety of possible testing scenarios and response patterns. The Department is also encouraged to perform its own checks on the accuracy of data capture in the test delivery system (TDS).

For all assessments, whether administered on paper or online, simulated data files are used to verify the accuracy of item and test scores and also to ensure that the online reporting system (ORS) displays test results accurately, including student-, class-, teacher-, and school-level reports. In addition, the same simulated test records are used to verify the production of printed score reports and data file deliverables, ensuring that all aggregation rules are implemented correctly.

7.5.6.1 Checking Mock Data

Mock or simulated data will be generated to verify the full range of test processes and deliverables. Three kinds of simulated data are used to verify test processes:

- Answer document test decks
- Online test decks and UAT
- Scoring and reporting data files

Imaging Test Decks. Prior to any Florida Standards Assessments PBT materials returning to DRC, DRC's Software Quality Assurance staff will perform extensive tests to ensure all scanned data (including demographic and multiple-choice responses) are captured and accurately stored in a secure database environment. Each record in the database will be independently verified against the test decks for validation.

The analysts will follow a software testing methodology that thoroughly evaluates and verifies the scanning and scoring system and verifies that each scanner is configured and set up for the Florida Standards Assessments. This process includes validating test decks, which will be comprised of answer documents with and without student and school pre-ID information for each form of the test.

The test decks will be specifically gridded to include a variety of possible student response situations, permutations, and combinations,

including erasures, multigrids, demographic values, score flag codes, school type values, and scores, including specific/alternating item response patterns. DRC manually grids all test decks. Test deck criteria and mock data cases will be developed to align with Scoring and Reporting Specifications and/or Department requirements.

The test decks will be processed completely through DRC's systems to verify the following:

- Readability of security, student, and school barcodes.
- Data capture of pre-ID and barcode information.
- Accurate capture of district and school codes.
- Consistent data capture on all scanners.
- Accurate scan positions on all documents and forms.
- Scanner calibration and hardware functionality.

The Software Quality Assurance staff will also perform a validation of all production data processed through the system. Each student record will be verified for accuracy to ensure high quality data file development and reporting. Please see Section 7.5.3 for detailed information on DRC's scanning technology, systems, and processes.

Online Test Decks. Online tests are different than scanned tests because the items are represented as data, and the programming is constant across items. This minimizes the risk that a "bug" will exist for a single item or for an item on a single form.

For fixed-form tests, AIR will work with the department to design test decks with a range of responses to each item and confirm that the system captures these items correctly. We write software testing scripts to run through the test decks on the fixed-form tests. Test scripts are better than humans in this regard, because a human might accidentally input an unintended response, making test results ambiguous. Test scripts can be verified for accuracy if an unexpected result appears in the data file.

If the Department chooses an adaptive model, a series of simulation studies is used to test the process. These simulations are described below.

The test decks are implemented on the production TDS so that final verification is performed on the operational test platform. Similar to test decks used to calibrate document imagining systems, we implement a series of test administrations designed to test all possible responses to selected-response items, as well as a range of possible responses to constructed-response items, to ensure that student responses are captured accurately and that item responses are scored correctly.

Although AIR is solely responsible for identifying any issues related to item response capture, the Department may also wish to implement its own online test decks during the UAT window. AIR will provide the Department with data files containing all Departmental UAT test records to verify that captured test records match with data entry records implemented by the Department.

Simulator Data Files. While we do verify the scoring of item responses and test scores and performance levels using the UAT input records, test deck data is limited with respect to scoring of test records, especially with pattern scoring where there are thousands of possible test scores. Therefore, we verify the accuracy of the scoring engine using simulated test administrations. The simulator generates a sample of students with an ability distribution that matches that of the state. The ability of

each simulated students is used to generate a sequence of item responses consistent with the underlying ability. These simulations provide a rigorous test of the adaptive algorithm for adaptively administered tests but also provide a check of the full range of item responses and test scores in fixed-form tests. Simulations are always generated using the production item selection and scoring engine to ensure that verification of the scoring engine is based on a very wide range of student response patterns.

To verify the accuracy of the ORS, we merge item response data with the demographic information taken either from previous-year assessment data, or if current year enrollment data is available by the time simulated data files are created, we can verify online reporting using current-year testing information. As noted in the ITN, by populating the simulated data files with real school information, it is possible to verify that special school types and special districts are being handled properly in the reporting system.

Test accommodations, including large print, text-to-speech (TTS), as well a host of other available accommodations such as foreign language versions described in Section 7.3.11.1, will be provided for the online tests. In the online system, accommodations are provided as tags to items in the item bank. Because accommodations are attributes of items, rather than adaptations of specific test forms, the accommodations travel with the item and eliminate the need to produce special accommodated test forms. Moreover, because the Item Tracking System (ITS) uses the same item display software used by the TDS, as soon as items are tagged with an accommodation, the Department, AIR, and the quality assurance (QA) contractor can verify that the accommodated version of the test item is being displayed correctly, allowing verification of accommodated items to occur well before the beginning of the test administration window. In a fixed-form environment, it is more cost-effective to tag items for accommodations after the operational test form has been built, so that the Department does not pay for accommodations until the item is used. However, because the items in each of the candidate Florida Stanards Assessment (FSA) banks were built for use in a Comprehensive Assessment Test (CAT) environment, all items in the initial pool have already been tagged with accommodations. For this reason, even if the Department chooses to administer fixed-form assessments, it may still be cost-effective to provide accommodation tags annually following item data review for items promoted to the operational pool.

In addition, because data capture is identical for accommodated and non-accommodated items, a separate process for verifying correct capture of accommodated responses is not necessary. Test cases for accommodated test administrations are designed into the online test deck and can be incorporated into the Department's UAT. For accommodations provided via paper test forms, test administrators will use the data entry interface (DEI) to submit student responses. The DEI provides a user-friendly environment for data entry that mirrors the student's test booklet to reduce the likelihood of data entry errors. The functionality of the DEI is also verified using the online test decks.

Specifications for generating simulated data files, including the test deck designs for both paper and online assessments, as well as the design of simulation runs to verify scoring and reporting, will be included in the scoring and reporting specifications document submitted to the Department each year. We understand the Department's requirement that review of all simulated data be completed prior to the opening of the test administration. And in fact, this requirement is of even greater import in the context of an online system that supports

immediate scoring and reporting. Before the test window opens each year, integrity of item administration, data capture, item and test scoring and reporting must be verified. Even if test results initially reported in the ORS areas are marked as preliminary, the reality is that there is no room for error in the reporting of students' assessment results.

7.5.6.2 Checking Early District Return Data

AIR and DRC understand that the Department will select certain districts to be part of the early district return sample for detailed analysis and quality verification for paper-based tests. DRC will work with selected districts to collect and return the test materials to DRC for receiving, processing, and scanning. Prior to the return of these early district test materials, DRC will put in place mechanisms to immediately identify and prioritize the boxes of early return answer documents from these districts and process them on a first-priority basis through check-in and scanning. To verify the accuracy and quality of scanning and scoring, DRC will use the early return student answer documents to conduct completed runs. The results from the early returns will be thoroughly checked to ensure that the hardware and programming specifications are working correctly and to verify all early return data. Please see Section 7.5.3 for a detailed discussion of DRC's processing and scanning systems, technology, and processes.

DRC welcomes the opportunity to host representatives of the Department at DRC's secure scanning facilities for spring scan checks. DRC understands that the scan checks for other administrations may occur either at DRC's facilities or at Department offices. DRC will provide all early return original and edited scan files to the Department no later than three business days prior to the on-site reviews. For scan checks performed at the Department's offices, AIR and DRC will also provide PDF documents of all early return answer documents via AIR's secure FTP site. AIR and DRC have proposed an accurate and efficient alternative to using header sheets/Document Count Forms (DCFs); please see Section 7.4.7.5 for more information. Only after the Department is completely satisfied with the accuracy of the early return files and results will AIR and DRC continue with processing, scanning, scoring, and reporting routines for each paper-based test administration.

DRC looks forward to the Department's on-site visits to its scanning facilities. AIR and DRC will cover all travel expenses for Department staff to complete the scan checks within the reimbursable funds. We understand that the on-site scan checks may require one or two consecutive weeks to complete, dependent upon the availability of Department staff. AIR and DRC further understand that the Department's independent contractors may participate in on-site scan checks, or that they may visit DRC's scanning facilities prior to the Department's scan checks.

During the on-site scan checks, DRC will ensure that Department staff are provided with computers and access to e-mail and a high-speed printer, as well as access to the CBTs, SAS (if requested), any key entry verification logs as applicable, and early return answer documents, including Braille, large print, and OIPP documents and updated Special Document Tracking logs. All answer documents will be batched, organized, and logically sequenced for easy access. All materials and systems will remain secure with DRC's fully secure scanning facilities.

7.5.6.3 Checking Data for Anomalous Scores

Forensic Analysis of Test Administration (Online)

Online test administration allows the Department to track information that is not possible to track in the context of the paper-and-pencil tests. This information includes not only item responses but also item response changes, latencies between item responses and changes, number of revisits to an item or items, test start and end times, scores in each opportunity in the current year, scores in the previous year, and other selected information in the system (e.g., accommodations). Our TDS captures all of this information.

Throughout the testing window, AIR routinely produces a set of QA reports to ensure the quality of the assessment system. One of the QA reports aggregates unusual responses at the student level to detect possible group-level testing anomalies.

AIR psychometricians monitor testing anomalies throughout the test administration window. Evidence evaluated includes changes in test scores across administrations, item response time, and item response pattern using the person-fit index. The flagging criteria used for these analyses are configurable and can be changed by the user. The analyses used to detect the testing anomalies can be run anytime within the testing window. Analyses are performed at student-level and summarized for each aggregate unit, including testing session, test administrator, and school.

Changes in Student Performance

Score changes are examined within (for multi-opportunity assessments) and between years using a regression model. For within-year comparisons, the most recent opportunity is regressed on previous performance (2nd most recent score), controlling for the number of days between the two administrations, to identify performance gains or losses that are substantially greater than might reasonably be expected.

For between-year comparisons, the scores between past and current years are compared, with the current-year score regressed on the test score from the previous year. Between-year comparisons can be performed starting with the second year of the test administration.

A large score gain or loss between grades is detected by examining the residuals for outliers. The residuals are computed as observed value minus predicted value. To detect unusual residuals, we compute the studentized t residuals. An unusual increase or decrease in student scores between opportunities is flagged with studentized t residuals greater or less than |3|.

The number of students with a large score gain or loss are aggregated for a testing session, a test administrator, and school. Unusual changes in an aggregate performance between opportunities and between years are flagged based on the average studentized t residuals in an aggregate unit (e.g., a testing session or a test administrator). For each aggregate unit, a critical t value is computed and flagged with t greater or less than |3|,

$$t = \frac{Average\ residuals}{\sqrt{\frac{s^2}{n} + \frac{\sum_{i=1}^{n} var(e_i)}{n^2}}},$$

where s = standard deviation of residuals in an aggregate unit; n = number of students in an aggregate unit (e.g., testing session or test administrator); and $var(e_i) = \sigma 2\ (1\text{-}h_ii)$. The QA report includes a list of the flagged aggregate units with the number of flagged students in the aggregate unit.

If the aggregate unit size is 1–5 students, the aggregate unit is flagged if the percentage of flagged students is larger than 50% (%flagged students > 50%). The aggregate unit size for the score change is based on the number of students included in the within- or between-year regression analyses in the aggregate unit.

Item Response Latency

Item response latency is captured as the item page time (the time each item page is presented) in milliseconds. Discrete items appear one item on the screen at a time. However, for stimulus-based items selected as part of an item group, all items associated with the stimulus are selected and loaded as a group. For each student, the total time taken to complete the test is computed by summing up the page time for all items and item groups.

The expectation is that the item response time will be shorter than the average time if students have prior knowledge of test items. An example of unusual item response time would be a test record for an individual who scores very well on the test even though the average time spent for each item is far less than that required of students statewide. If students already know the answers to the questions, the response time will be much shorter than the response time for those items where the student has no prior knowledge of the item content. Conversely, if a test administrator helps students by "coaching" them to change their responses during the test, the testing time could be longer than expected.

The average and the standard deviation of test-taking time are computed across all students for each opportunity. Students and aggregate units are flagged if the test-taking time is greater than or less than 3 standard deviations of the state average—i.e., stage average $\pm$ 3SD (default criteria). The state average and standard deviation is computed based on all students at the time the analysis is performed. The QA report includes a list of the flagged aggregate units with the number of flagged students in the aggregate unit.

Inconsistent Item Response Pattern (Person Fit)

In Item Response Theory (IRT) models, the person-fit measurement is used to identify examinees whose response patterns are improbable given an IRT model. If a test has psychometric integrity, little irregularity will be seen in the item responses of the individual who responds to the items fairly and honestly.

If a test-taker has prior knowledge of some test items (or is provided answers during the exam), the student will respond correctly to those items at a higher probability than indicated by his or her ability as estimated across all items. In this case, the person-fit index will be large for the student. However, if a student has prior knowledge of the entire test content, this will not be detected based on the person-fit index, although the item response latency index might flag such a student.

The person-fit index is based on all item responses. An unlikely response to a single test question may not result in a flagged person-fit index. Of course, not all unlikely patterns indicate cheating, as in the case of a student who is able to guess a significant number of correct answers. Therefore, the evidence of person-fit index should be evaluated along with other testing irregularities to determine possible testing irregularities. The number of flagged students is summarized for every testing session and test administrator.

The person-fit index is computed using the standardized log-likelihood statistic. Following Drasgow, Levine, and Williams (1985), Sotaridona, Pornell, and Vallejo (2003) define aberrant response patterns as a deviation from

the expected item score model. Snijders (2001) showed that the distribution of l_z is asymptotically normal (i.e., with an increasing number of administered items, i). Even at shorter test lengths of 8 or 15 items, the "asymptotic error probabilities are quite reasonable for nominal Type I error probabilities of 0.10 and 0.05" (Snijders, 2001).

Sotaridona et al. (2003) report promising results of using l_z for systematic flagging of aberrant response patterns. Students with l_z values in excess of $\pm$3.0 are flagged. Aggregate units are flagged with t greater or less than |3|.

$$t = \frac{Average\ l_z \text{ values}}{\sqrt{(s^2 + 1)/n}},$$

where s = standard deviation of l_z values in an aggregate unit and n = number of students in an aggregate unit. The QA report includes a list of the flagged aggregate units with the number of flagged students in the aggregate unit (e.g., school, test administrator, test session).

Sample Report

The QA report can be generated for each subject or all subjects combined. The analysis report is generated at different aggregate units (e.g., testing session, test administrator, or school). The report includes two tabs: the student tab and the aggregate tab. The student tab includes information on students who are flagged with at least one of the flag indices in each flagged aggregate unit. The aggregate tab includes information on the aggregate units that are flagged with at least one of the flag indices.

Exhibit 7.5.6.3-1 presents a sample QA report for testing irregularity analyses for testing sessions. The table includes a list of the cheating indices for the flagged aggregate units.

Forensic Analysis of Test Administration (Paper)

AIR team member DRC provides anomalous data review for numerous clients, giving the company the expertise and capability to offer similar services to the Department. DRC's in-

Exhibit 7.5.6.3-1: Systems Summary

Testing Period: October 17, 2011, to December 31, 2012

					Cheating Index (# of Flagged Students)											
					Score Change Within Year			Score Change Between Year			Response Time Flag (# of Flagged Students)			Person Fit Index (# of Flagged Students)		
Test ID	Aggregate Type	School ID	Total # Students	Total # Students Flagged	Most Recent Score	Second Most Recent Score	# of Students Flagged	Most Recent Score in Current Year	Most Recent Score in Previous Year	# of Students Flagged	Opp1	Opp2	Opp3	Opp1	Opp2	Opp3

house psychometric staff will provide all anomalous score/test irregularity data review for paper-based tests for the Florida Standards Assessment. AIR and DRC will work with the Department to develop procedures for this process, with the Department having final approval over all procedures that will be implemented by DRC.

After scanning of all documents for each administration has been completed and prior to report generation, DRC will review all student and school scores for anomalous data and testing irregularities to identify any data that would not be considered a valid measure of student achievement or that might be considered evidence of suspicious activity. If data irregularities are found, DRC will notify the Department, which may request that some of the impacted data be withheld from release, pending additional investigation. AIR and DRC will work with the Department to set up rules regarding the use of Score Status Flags during reviews between the first and second versions of the full-state student results files. AIR will ensure that adequate time for the anomalous data review process is reflected in the program schedule, while still providing for on-time report deliverables.

The following sections provide information on DRC's mark discrimination technology and procedures and response data analysis process.

Mark Discrimination

The image scanners used by DRC utilize high quality color cameras capable of capturing images up to 300 dpi. Gray-scale images are captured using 256-level gray-scale (8 bits per pixel) format. DRC's image scanning system produces sufficient image quality to permit distinguishing between various marks and darkness levels and allows DRC to store electronic responses that emulate the quality of the original paper response. The flexibility of DRC's image scanning system allows for erasure marks to be easily captured based on specified criteria. DRC's scanners are calibrated multiple times daily to ensure that scanners accurately and consistently capture student responses.

All marks on a student answer document are captured at the time of scanning. Marks for multiple choice responses will be assigned a read level. Each response bubble is scored based on two factors: darkness (how darkly the bubble is marked); and pixel coverage percentage (how much of the bubble is marked). Using darkness and pixel coverage, each bubble is assigned a value based on industry standards. The value is assigned to one of three ranges: unmarked or very lightly marked; lightly marked; or clearly or darkly marked. Then, each question is assigned a response based on the value for each of its bubbles:

- If only one bubble is marked, then the response is set to that bubble.
- If two bubbles are marked, and one is lightly marked and the other is clearly marked, then the response is set to the clearly marked bubble.
- If two bubbles are marked, and both are lightly marked or both are clearly marked, then the response is marked for review by a human editor.
- If all bubbles are unmarked or only very lightly marked, the response is marked for review by a human editor.

Generally, any item for which the scanning process determined that more than one bubble was marked will be evaluated for erasures. AIR and DRC will work with the Department to define erasure classification criteria. There are three types of erasures: wrong-to-wrong (WW); right-to-wrong (RW); and wrong-to-right (WR). These responses will be aggregated at the state level to determine what is typical erasing

behavior and the baseline for comparisons of subgroups, whether district, school, classroom, or other identified subgroup level.

The average number of WR erasures will be computed for each subgroup (e.g., school) statewide. This average is evaluated in terms of the meaningful statistical difference from the state-level WR erasure rate. The Department will receive a report with each subgroup's average erasure rates as well as an indication of how improbable the erasure rates are, given the state level. These reports can be generated at the district, school, classroom, or other identified subgroup level. An illustration of what this report may look like is shown in Exhibit 7.5.6.3-2.

In the example, the indication of the improbability of the erasure rate is given by the Outlier Score. The higher the Outlier Score, the more different the school's average WR erasure rate is from the state level. The Outlier Score is a translation of the probability of occurrence.

The Outlier Scores highlighted in pink are an indication of unlikely erasure results that may warrant further investigation. This Outlier Report would accompany a written summary of results and methodology.

In addition to analyzing erasure data at a subgroup level, DRC could produce supporting materials for an erasure analysis. An example of such supporting materials may be an enhanced erasure map report. This report has been a primary tool in reporting answer change analyses results for many of DRC's clients. It provides a clear visual summary of what is happening inside a school. Key aspects of this report include the following:

- Identification of key levels of aggregation (i.e., district, school, and student)
- Color-coded shading indicating type of answer change (wrong to right, right to wrong, or wrong to wrong)

Exhibit 7.5.6.3-2: Sample Outlier Score Report

Gr	DistrictID	DistrictName	SchoolID	SchoolNa	Subject	N	WR/Test	SD	Outlier Score
5					MATH	116	1.6	1.7	13.9

- Shading of the field-test item columns to easily distinguish them from operational items

Exhibit 7.5.6.3-3 shows a sample erasure map report. The erasure map is an Excel document, which allows the user to filter data on a grouping category. It will help provide visual answers to such questions as these:

- Within the school, do the field-test items have a similar erasure pattern as the operational items?
- Within the school, are the same items being erased?
- Are the erasure patterns consistent for a student across subjects?

Usual Increase in School Performance

It is anticipated that performance on the Florida Standards Assessment will improve over time due to legitimate reasons such as changes in the curriculum and improvement in instruction. However, large and unexpected score changes may be a sign of suspicious activity. An approach to identifying improper behavior is to compare the state's level of change in performance from one year to the next to a school's change in performance during the same timeframe. This comparison will determine if a school's average score change is statistically different from the statewide average score change. Schools, as with erasure analysis, will be identified with an Outlier Score. As with any statistical test, there is Type I error and the possibility of false positives. The criterion used to identify statistically different situations will be smaller than the usually expected 0.05 alpha level, thus reducing the chance of falsely identifying schools. Results will be presented in a manner clarifying that statistical indicators are not proof of improprieties but rather flags for situations that could warrant further investigation.

Response Patterns

Student test responses can be analyzed for unusual testing patterns. DRC has had success in implementing a modified approach used by Jacob and Levitt (2003), which incorporates multiple approaches to pattern analysis. Suspicious answer strings may be identified by examining responses for

- unlikely blocks of identical consecutive answers;
- degree of similarity beyond consecutive items as assessed by the degree of correlation in all student responses; and
- cases in which students miss easy items while answering difficult items correctly.

These methods combine into an index that can be used to identify schools showing unexpected answer patterns and which may require further attention. It is possible for unexpected answer patterns to appear without inappropriate behavior having occurred. For this reason, the pattern index is combined with an index measuring unexpected test score fluctuations across years using a cohort of students.

Exhibit 7.5.6.3-3: Sample Erasure Map

Form	Mode	WR	1	2	3	4	5	6	7	8	9	10	11	12	13	14	17	18	19	20
1	O	13	3	C	D	1	C	C	A*	1	C*	2*	D	A	3*	B	B	3*	3	C*
19	O	12	D	C	D	B	C	C*	A	D*	2	4	C	B	2	A*	B	2	A	C
18	O	11	D	C	2	3	C*	1	3*	D*	C	1	C*	3	C	A	1*	A*	A	C*
16	O	9	D	C	1	3	1*	C	A	3	C*	3	2	D*	3*	1	3	A*	3	2
1	O	9	3	2*	D*	3	1*	1	4	2	C	2	D	A*	B	3	3	2*	3*	4
17	O	9	0*	C	D	B*	C*	1	A*	D	C	4*	1*	2	1*	A*	B*	2	4	C

Schools are ranked on both indices and flagged if in the 95th percentile on both. By ranking the schools on both indices, Type I error is lower than if using only one index. Thus, schools are protected from being incorrectly identified.

Should the Department determine that its data forensic needs are broader, DRC welcomes an opportunity to share its expertise. DRC has extensive experience in assisting departments of education across the country with their data forensic studies. Additionally, DRC continues to research emerging and state-of-the-art detection methodologies, presents at national conferences (including the Annual Statistical Detection of Potential Test Fraud Conference); and updates developments in security guidelines from the National Council on Measurement in Education (NCME), Institute of Education Sciences National Center for Education Statistics, and Technical Issues in Large Scale Assessment (TILSA).

7.5.6.4 Checking Full-State Data—Initial Reporting

Online Reporting System Verification

Whether tests are administered on paper or online, scores will be reported back on both paper and online. Ideally, the online reports will be delivered in real-time, relying on operational item keys, machine rubrics, and pre-equated item parameters. As test results come back from the TDS or scanning-scoring process, they are routed to our Test Integration System (TIS) and Quality Monitor (QM) system and ultimately to our systems for reporting. The following quality checks are implemented:

- The student response and score data to be reported are correct.
- The reporting software systems accurately report and aggregate the student scores.
- Paper reports contain accurate data correctly displayed, and any Florida-specific programming is tested and replicated to ensure that it is error free.
- Print and packaging quality is maintained for paper reports.

Scoring and Reporting Specifications

Each year, AIR will provide the Department with specifications for scoring and reporting. In addition to detailing the IRT calibrations and ability estimation procedures, the specifications document includes rules for validating test records (i.e., attemptedness and invalidated records) and aggregating test records (including handling of special schools and districts). Also included are specifications for all paper and online reports at each level of analysis, including family reports, and classroom-, teacher-, school-, and district-level roster reports, summary reports, growth reports, and reporting of relative strengths and weaknesses of strand- and benchmark-level standards. Included as well are specifications for all downloadable data files from the ORS. Upon Departmental sign-off on the scoring and reporting specifications, statistical programming of the ORS will begin, with final verification of the ORS functionality scheduled to be complete prior to launch of the production ORS for UAT.

Student Response and Score Data are Correct

Data entering the reporting process, either from paper or online tests, flow through our QM software, described in detail under Section 7.5.4. QM conducts a series of data integrity checks, ensuring, for example, that the record for each test contains information for each

item that was supposed to be on the test and that the test record contains no data from items that have been invalidated. QM scores the test, recalculates performance-level designations, calculates subscores, compares item parameters to the reference item parameters in the bank, and conducts a host of other checks.

QM also aggregates data to detect problems that become apparent only in the aggregate. For example, QM monitors item fit and flags items that perform differently operationally than their item parameters predict. This functions as a sort of automated key or rubric check, flagging items where data suggest a potential problem. This automated process is similar to the sorts of checks that are done for data review, but (a) they are done on operational data; and (b) they are conducted in real time so that our psychometricians can catch and correct any problems before they have an opportunity to do any harm. Reports on item quality are available to our psychometricians on-demand through an automated, online system.

Reporting System Software Accurately Reports and Aggregates Student Scores

Online reports appear in real time. Therefore, QA cannot rely on post-hoc reviews of reports. Instead, the accuracy of the reporting system rests on the quality of programming of the system, the implementation of the Department's business rules, and the quality of the algorithms used for aggregating scores. These processes are described in Section 7.5.5.

In building our systems, we undergo an extensive software testing process. When we configure the systems for individual clients, we test them by running simulated or real data through the full system, allowing the system to generate reports. Our statistical programming team simultaneously implements the same rules and processes the same data. Statistics from the system are then compared to statistics produced by our statistical team. Discrepancies are tracked down and resolved.

As described in Section 7.5.5, this entire process is guided by a set of complete reporting and analysis specifications. Both the software team and the independent statistical programming team work from the same specifications but work independently. This process provides an independent check on the immediate reporting system before it is deployed. Of course, the Department is welcome to review the data at any time.

7.5.6.5 Checking Graduating Student Scores (Manual Rescore)

For the high stakes grade 10 English Language Arts/Literacy (ELA/L) and Algebra 1 End-of-Course (EOC) assessments, which are required for graduation, the Department requires that paper test administrations be manually rescored for students failing by five scale-score points or 15 developmental scale-score points.

We recognize that the FSA may have a reporting scale that differs from the current FCAT 2.0 scale or the developmental scale. We assume that the boundaries for rescore will be translated to the FSA scale to target approximately the same number of students for rescores.

We note that both the Algebra 1 and Grade 10 ELA/L tests will be delivered primarily online. Online tests can be reviewed. AIR's has a well-seasoned system for exactly this type of review: The Secure Item Response Viewing Environment (SIRVE), which provides a view for authorized users to step through the student's test. SIRVE uses the same code as the Test Delivery System (TDS) Student Interface to ensure that the viewing experience is pre-

sented exactly the way it was presented when the student took the test, and presents the student response exactly as the student saw it.

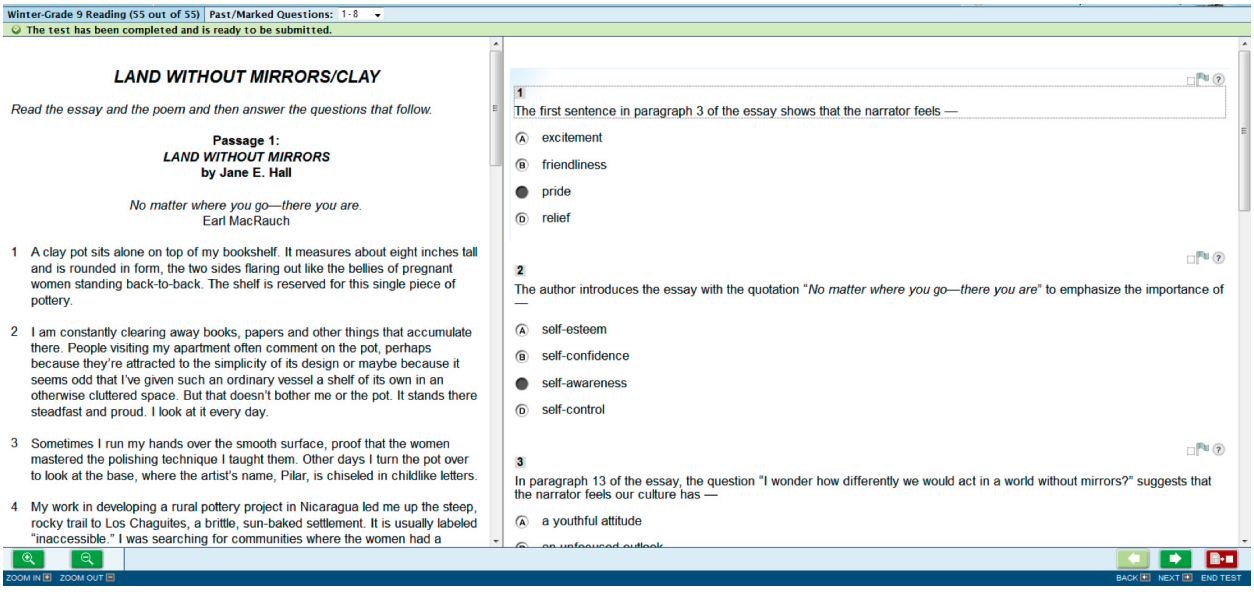
Once the authorization and identification are confirmed, the authorized user can then view all of the student test's items and responses. Refer to Exhibit 7.5.6.5-1 for a sample screen capture of this view. The user can navigate through the test by using the same buttons and tools as the student such as the Back and Next buttons, the Mark for Review drop-down menu, and the End Test button.

When students who took the accommodated paper form fall within the rescore boundaries, DRC will initiate and track the student response document retrieval and rescore process. Processed answer documents will be retrieved quickly and efficiently as the need arises, either during or upon completion of processing. Original hardcopies of individual student tests will be easily retrievable because of DRC's effective document storage procedures. Additionally, DRC's IBML image scanners and Image Scoring System allow for on-demand retrieval of specified images (e.g., specific batch files, specific grades, specific students); each image is assigned a unique identification number that allows for quick and easy retrieval at the student and school levels.

After the appropriate student response documents have been retrieved, they will be reviewed manually by experienced and qualified personnel who will scrutinize the responses to verify student identification information and confirm that the items have been scored as the student intended, looking for such issues as unintentional stray marks in the answer bubbles, incomplete erasures, or unintended double gridding. In addition, rescore personnel will look for any irregularities in editing or processing by comparing all item responses to the values on the SSR. All applicable security and quality-control procedures that were implemented by DRC during the original processing and scoring will be maintained.

If any problems are identified that cause a student's score to change to a passing score, the data will be revised and information will be reported in the first wave of late reporting,

Exhibit 7.5.6.5-1: SIRVE Sample Screenshot



with a new student report being produced and distributed to the student's district. Data from this student's rescore will also be included on the School Report of Students sent with the other first wave of late reporting student data. In addition, AIR and DRC will provide the Department with a report that details the number of student tests reviewed by subject and the number of rescores that resulted in a passing status. AIR and DRC understand that if rescoring does not result in a passing score, no change will be made in the record.

7.5.6.6 Checking Late Reports

The same procedures used to verify the accuracy of answer documents, test scores, and score reports received during the on-time reporting window will be applied to all documents received following the close of the on-time window. As we describe in Section 7.5.5, all answer documents, including those received after the on-time window, are imaged, with machine-scored item responses uploaded to the QM, where item responses and test scores are verified prior to being routed to the Database of Record (DoR). Item responses requiring human scoring are routed to the performance scoring system and are then uploaded to the TIS, where hand-scored items are stitched back to the test opportunity record. The single, integrated test opportunity record is again passed through the QM before being deposited into the DoR. Student item and test scores are then routed to the ORS, which incorporates student enrollment and demographic information, along with user information, to produce score reports and downloadable data files. All of these systems are thoroughly verified prior to launch of the online testing window, so that all reporting, whether generated in the on-time window or later, are accurately produced.

7.5.6.7 Checking Close-Out and Annual EOC Files

The same QA processes used to verify the accuracy of item and test scores, and the score reports and data files produced from them, will be applied to the generation of close-out and annual EOC files.

7.5.6.8 Checking Demographic Files

As we describe in Section 7.5.4, the Department may choose to manage enrollment data directly and pass that information to the Test Information Distribution Engine (TIDE), or districts may upload and manage enrollment data directly in TIDE. Student and user data collected in TIDE, or passed through to TIDE by the Department's system, would be stored in the Roster Tracking System (RTS) database—a flexible database system shared by TIDE, TDS, reporting, and the Data Extract Generator (DEG) systems. This database ensures one reliable, common source for all student and user registrations. Data can be loaded into RTS (through TIDE) by either an automated data exchange through a secure file transfer protocol (SFTP) location or a user-based upload. Because these data control student eligibility for specific tests and can control availability of individual accommodations and supports, students who are not represented in the RTS are not eligible for test administration. However, we also understand that student data are not static and may need to be updated prior to final reporting. Moreover, because some assessments are still paper-based, and schools will continue to use generic PreID labels on answer documents when student PreID labels are not available, a mechanism is necessary for updating student and user information in TIDE.

To accomplish this, we propose to open TIDE to districts or accept updated enrollment records directly from the Department, for a period during the testing window. This will allow districts to make any necessary updates to student and user data to ensure the most accurate reporting of assessment results, while also allowing final results to be generated immediately following the close of the test administration window each year.

7.6.0 Scaling, Equating, Scoring, and Special Psychometric Studies

7.6.0 Scaling, Equating, Scoring, and Special Psychometric Studies

One of the principle advantages of online assessments is that they allow for the possibility of immediate scoring and reporting of test results, which educators and students actually expect following online test administration. Should Florida decide to build on the Student Assessment of Growth and Excellence (SAGE), the entire assessment is machine scored, with the exception of some parts of the writing assessment.

Immediate scoring and reporting of test results requires that tests be scored using pre-equated item-parameter estimates. Given that item parameters are generally estimated based on large and representative samples of student responses to field-test items embedded within operational test administrations, pre-equated item-parameter estimates are highly precise and stable over time. Pre-equating has the additional benefit of eliminating the need to identify a sample of schools for early return and processing to support post-equating analyses.

The Department has historically used a post-equating approach to calibrating and equating item parameters for scoring paper assessments, adopting a pre-equating approach only for the grade 10 retake tests which are administered to a highly selected sample of students. In a paper-based assessments system, the time required to retrieve, process, and hand score answer documents is such that states, with the use of early return calibration samples, could complete post-calibration activities in a timeframe that had little or no impact on the score reporting timeline. Of course, reports were also typically distributed in the summer months when schools were not in session, reducing the overall value of score reports to families and educators. With the advent of online testing and the possibility of immediate scoring and reporting of test results, the expectation and valuation of immediate feedback may outweigh the relatively small gains in measurement precision that may accrue from post-equating—with the possibility of real-time reporting of test results, there are now costs associated with post-equating that likely do not outweigh the benefits of immediate feedback.

For grades and subjects where assessments are administered in paper format, we propose to maintain the Department's post-equating approach to scoring test results. For these assessments, AIR will provide the Department with a plan for drawing early return samples on which to conduct post-equating analyses, analysis specifications identifying the Item Response Theory (IRT) models for calibrating each item type, and the equating procedures for transforming the post-equated item-parameter estimates back to the reference scale, as well as simulated data files to support dry runs of all post-equating activities.

As assessments move online, however, we propose to use a pre-equating design for scoring and reporting assessment results to support immediate reporting of test scores. We clearly recognize that any decision to move away from post-equating for the online assessments will be made by the Department, and we are prepared to continue implementing the post-equating approach to the scoring of online assessments if the Department chooses.

Moreover, while the item banks available to construct the Florida Standards Assessment (FSA) are already calibrated, the Department may wish to establish a uniquely Florida reference scale. In this approach, the Department would re-calibrate the operational test items following the first test administration and then identify the linking constants necessary to bring all other bank items onto the new Florida scale. All subsequent operational test administrations could then be scored using pre-equated item parameters on the Florida

scale. If the Department intends to establish performance standards following the first operational test administration, then immediate score reporting will not be possible for the first test administration in any event, so establishing a new reference scale would not hinder the reporting of test results.

Calibrating, Scaling, and Equating

Calibration is the process by which we estimate the statistical relationship between item responses and the underlying trait being measured. AIR proposes to continue to use statistical models based on IRT (Allen & Yen, 1979; Birnbaum, 1968; Lord & Novick, 1968) to calibrate the items to a common scale. AIR is experienced with a wide range of IRT models, extending from the simple one-parameter (or Rasch) model (Rasch, 1980; Cohen & Kolstad, 2000) to multi-parameter models (Johnson, 1992; Beaton, Johnson, & Ferris, 1987) and even to cutting-edge multicomponent models (Cohen & Kolstad, 2000).

The Department has traditionally used the more general IRT models to describe student performance on test item. These more complex models (essentially, models that acknowledge the possibility of guessing on multiple-choice items and recognize that some items measure with less error than others) do not offer a one-to-one correspondence between raw scores and scale scores. Although some psychometricians (Thissen & Orlando, 2000; Thissen, Nelson, & Swygert, 2000; Yen, personal communication, 1999) advocate mechanisms by which raw-score conversion tables can approximate the scores that would be assigned on the basis of these more complex models. AIR recommends that scores be calculated using maximum likelihood with boundaries for the perfect scores (all correct or below chance), and this is consistent the Department's approach to scoring tests.

Overview of Some Common IRT Models

Traditional IRT models assume a single underlying trait and assume that items are independent given that underlying trait. In other words, the models assume that given the value of the underlying trait, knowing the response to one item provides no information about responses to other items. This basic simplifying assumption allows the likelihood function for these models to take the relatively simple form of a product over items for a single student:

$$L(Z) = \prod_{j=1}^{n} P(z|\theta),$$

where Z represents the pattern of item responses and θ represents a student's true proficiency. Traditional IRT models differ only in the form of the function $P(Z)$. The one-parameter model (1PL, also known as the Rasch model), which is used for items that are scored either right or wrong, takes the form

$$P(x_j = 1|\theta_k, b_j) = \frac{1}{1+e^{-1.7(\theta_k - b_j)}} = P_{j1}(\theta_k).$$

The b parameter is often called the *location* or *difficulty* parameter—the greater the value of b, the greater the difficulty of the item. The one-parameter model assumes that the probability of a correct response approaches zero as proficiency decreases toward negative infinity. In other words, the one-parameter model assumes that no guessing occurs. In addition, the one-parameter model assumes that all items are equally discriminating. (The typical formulation of the Rasch model does not include the arbitrary constant 1.7 factor in the exponential—the factor is included here for consistency with the more general models described below.)

The two-parameter logistic model (2PL) takes the form

$$P(x_j = 1|\theta_{k,}a_j, b_j) = \frac{1}{1+e^{-1.7a_j(\theta_k - b_j)}} = P_{j1}(\theta_k).$$

The b parameter is still called the *location* or *difficulty* parameter. The a parameter is often referred to as the *slope* or *discrimination* parameter. The slope parameter is essentially the inverse of the standard deviation of the measurement error associated with the item.

For multiple-choice models, the three-parameter logistic model (3PL) adds a "guessing parameter," so the probability of a correct response is given by

$$P(x_j = 1|\theta_{k,}a_j, b_j, c_j) = c_j + \frac{1-c_j}{1+e^{-1.7a_j(\theta_k - b_j)}} = P_{j1}(\theta_k).$$

The third parameter, c, defines a lower asymptote. In the one- and two-parameter model, the probability of a correct response approaches zero as proficiency decreases toward negative infinity. The third parameter allows the probability to approach some other lower bound. Given multiple-choice questions, a student with very little ability on the target trait could guess a right answer. The guessing parameter captures the effect of such guessing.

For items that have multiple, ordered response categories (i.e., partial credit items), we again have the choice of a simple Rasch family model (Master's 1982 partial credit model) or a more general variant such as Muraki's generalization of Samejima's (1972) graded response model. For smaller-sample tests (including, for example, many alternative assessments), we recommend the Rasch-family variants because they can be reliably estimated with fewer cases. Under Masters' model, the probability of a response in category i for an item with m_j categories can be written as

$$P\left(x_j = i|\theta_k, b_{j0} \ldots b_{jm_j-1}\right) = \frac{e^{\sum_{v=0}^{i} 1.7(\theta_k - b_{jv})}}{\sum_{g=0}^{m_j-1} e^{\sum_{v=0}^{g} 1.7(\theta_k - b_{jv})}}.$$

Muraki's generalization adds an item dependent discrimination parameter as follows (again, Masters' formulation does not usually include the arbitrary constant 1.7):

$$P\left(x_j = i|\theta_k, b_{j0} \ldots b_{jm_j-1}\right) = \frac{e^{\sum_{v=0}^{i} 1.7a_j(\theta_k - b_{jv})}}{\sum_{g=0}^{m_j-1} e^{\sum_{v=0}^{g} 1.7a_j(\theta_k - b_{jv})}}.$$

Returning to the likelihood equation, the contribution of each item to the overall likelihood function remains independent of all other items, given θ. This is convenient for two reasons: mixing models within an analysis (e.g., one-parameter and partial-credit items on the same scale) becomes no more complicated, and the likelihood of the response pattern may be calculated as the product of the likelihood of responses to individual items.

Estimation of IRT Models

AIR will use any software requested by the Department to calibrate item parameters. We prefer to use our own software, the *IRT Plugin* to our *AM* statistical software (*iAM*), which we distribute without charge (Cohen & AIR, 2002). *iAM* offers some capabilities that are not available from other packages, as we discuss below. We note, however, that AIR psychometricians currently use IRTPRO, Multilog, Parscale, and other software to calibrate item parameters using the more general IRT models in other state assessment programs, and we are therefore prepared to use any software requested by the Department.

iAM offers a key advantage over other available software because it provides design-consistent standard errors and yields accurate estimates of linking errors under complex designs. Like

Parscale, *iAM* includes a variety of constructed-response models (including the generalized partial credit model) that can be simultaneously estimated with two- and three-parameter logistic models on the same test. Like Bilog-MG, *iAM* can simultaneously estimate the proficiency distributions in multiple groups. Building on its design-consistent estimators, *iAM* provides fit statistics that reflect the complex sample design.

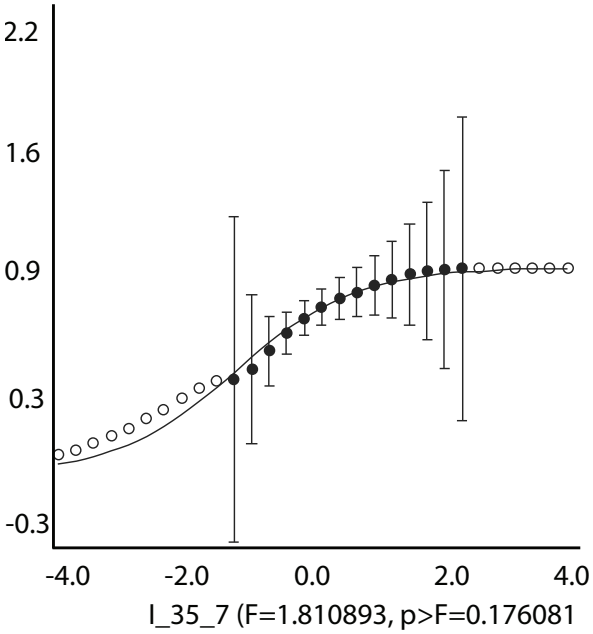
Like Parscale and Bilog-MG, *iAM* estimates item parameters by using *marginal maximum likelihood* (MML), which provides consistent estimates under the assumed proficiency distribution. MML estimation numerically integrates over the population proficiency distribution. In the absence of analytic solutions to the problem, finding the parameter values that maximize the likelihood of the data requires numerical optimization. The preferred method for finding the maximum likelihood estimate of such models is the use of the expectation maximization (EM) algorithm (Dempster, Laird, & Rubin, 1977). Bock and Aitkin (1981) propose an EM algorithm for this class of models, and this is the approach taken in popular IRT software.

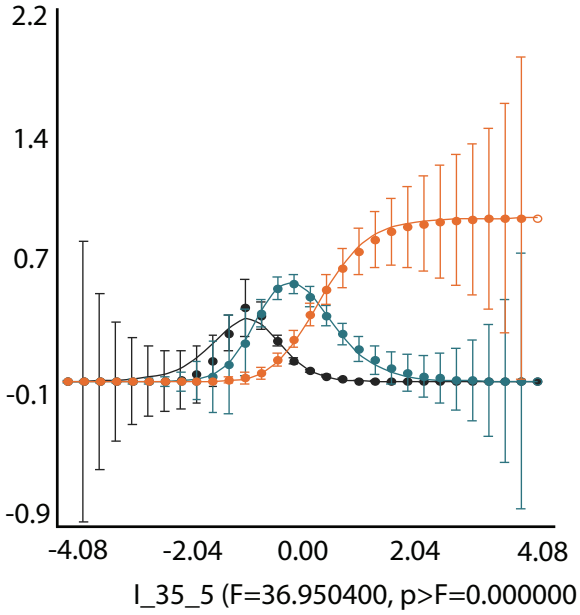
Evaluation of Model Fit

Psychometricians use a variety of measures to evaluate the fit between models based on IRT and observed item data (Yen, 1981; McKinley & Mills, 1985; Fitzpatrick et al., 1996). These statistics operate by evaluating the variance between observed and predicted item responses, a task made difficult by the fact that both the observed and the predicted item responses are contingent on the value of a latent trait (θ). Typically, some estimate of θ is used, and the discrepancy between the true and estimated values of θ is ignored. Fit statistics typically ignore a second source of error as well: the estimates of θ and the predictions both depend on a common set of item parameters that are themselves estimates. Hence, IRT fit statistics are notoriously conservative. This problem is compounded by the fact that item data almost always come from a complex, clustered sample. The end result is that typical IRT packages report significant χ^2 statistics for most items, regardless of actual fit.

AIR uses a fit statistic that overcomes these problems, incorporating uncertainty in the item parameter estimates and uncertainty in the estimates of the latent trait and taking into account uncertainty in the item statistics. When these sources of uncertainty are correctly accounted for, the χ^2 becomes an F statistic. *iAM* reports fit statistics along with innovative graphics that characterize the item fit, as shown in Exhibit 7.6.0-1.

Exhibit 7.6.0-1: Item Fit Graphics





The top panel in Exhibit 7.6.0-1 shows a sample fit graph for a well-fitting multiple-choice item, and the bottom panel shows a sample fit graph for a poor-fitting partial credit item. In both graphs, the *x*-axis represents the range of student ability values, the *y*-axis represents probability, the solid line represents the item characteristic curve (ICC), the dots represent the empirical estimates, and the bars indicate the standard error of the distance of the empirical estimates from the ICC. Note that the standard error bars are smaller near the center of the distribution and grow larger toward the tails. When the standard errors grow to be virtually infinite, the empirical estimates are represented as an empty circle.

The item in the first panel of Exhibit 7.6.0-1 shows a well-fitting item as misfit appears only at the tails of the distribution, where data is sparse and often not enough to draw valid conclusions. The second graph, however, shows misfit along the one-point line (represented as a black ICC). The empirical data points fall substantially off of the ICC line. Although no single point is outside of its confidence limit, the cumulative misfit across points is statistically significant, as depicted by the *F* printed at the bottom of the graph. These fit graphics were designed to provide clearer insights than the fit graphics typically produced by off-the-shelf programs. For example, some graphics use larger symbols to denote scores with more cases—a practice that is visually misleading. Estimates from large samples are precise and should appear at a precise point on the page, while estimates from small samples should appear more diffuse. Our graphics achieve this by graphing standard error bars. Near the center of the proficiency distributions, the estimates are precise, as shown by narrow error bars; they grow diffuse in the tails where little data appear, as shown by wide error bars.

Florida Technical Advisory Committee (TAC)

AIR will coordinate with the Department to designate the TAC meeting site. AIR's Conference Services team will support the logistics and make the lodging and meal arrangements for TAC meetings. AIR will reimburse TAC members for their services at the designated rates. AIR will distribute travel information and reimbursement paperwork prior to and/or during the meeting to ensure that committee members are knowledgeable about logistics, allowances, stipends, and reimbursements.

AIR will process per diems and will reimburse committee members' expenses according to mutually agreed-upon guidelines. AIR understands that the Department holds two TAC meetings annually in March and November. AIR is prepared to participate in both of these each year. Our proposed lead psychometrician, Dr. Harold Doran, will attend all TAC meetings. AIR typically sends additional staff as necessary. Often, this includes our director of psychometrics, Dr. Gary Phillips, and other psychometricians and statisticians who have led the studies to be presented at the TAC meetings.

Our project team will work with the Department to identify any required studies, issues, plans, or results that would benefit from TAC review. We will work with the Department to develop the TAC agenda and prepare the necessary materials. AIR will prepare materials to support the TAC meetings and deliver them for the Department's review. We propose to deliver them to the Department at least two weeks prior to each meeting to provide time for review and revision so that the materials may be distributed to the TAC members no later than one week prior to the meeting.

7.6.1 Assessments

The following sections provide detailed information about scaling, equating, and scoring for Florida Standards Summative Assessments and Retake Assessments.

7.6.1.1 Florida Standards Summative Assessments (Scaling, Equating, and Scoring)

As described in Section 7.3.7, AIR will annually provide the Department with test construction specifications consistent with the desired FSA model. For an adaptive assessment, the specifications culminate in a simulation technical report, which describes the configuration of the adaptive algorithm that maximizes measurement precision and blueprint match criteria and which documents the performance of the adaptive algorithm. For fixed-form assessments, the specifications also include test blueprints but additionally describe psychometric targets for test information and measurement precision as well as tolerances for deviations between test characteristic curves between forms. Equivalent test forms will be built to specifications and then submitted to the Department for review and approval.

In addition, AIR will produce a set of analysis specifications, as described in Section 7.6.2, detailing the procedures used to calibrate, equate, and score the FSAs. Although AIR proposes to use pre-equated item-parameter estimates to support immediate scoring and reporting of online test administrations, the Department has historically employed a post-equating approach to scoring assessment results, which AIR will certainly support.

IRT Models. The Department has historically calibrated multiple-choice items using the 3PL IRT model, the 2PL model for gridded-response items, and the generalized partial credit model for constructed-response items.

AIR will continue to calibrate these item types using the models preferred by the Department. In addition, AIR will review with the Department each of the available machine-scored item types and identify the most appropriate model for calibrating each item type. For example, while most machine-scored items are true constructed-response items, which are most appropriately scored using the 2PL or generalized partial credit (GPC) IRT models, there may also be some hot-spot items, which are essentially multiple-choice items that may be most appropriately calibrated under the 3PL IRT model.

Equating Method. To link test items back to the Florida reference scale, the Department has traditionally employed the widely used Stocking-Lord (Stocking & Lord, 1983) method for minimizing squared differences between test characteristic curves of linking items across forms. To verify the robustness of the linked-parameter estimates, the Department also prefers to replicate the equating procedure using alternative methods, including moment-based mean/mean and mean/sigma transformations, and the Haebara (1980) method of minimizing the sum of squared differences between item characteristic curves of linking items across forms. AIR psychometricians are prepared to apply any methods the Department wishes to equate test forms.

Maximum-Likelihood Estimation (MLE) Scoring. As noted previously, AIR recommends computing test scores using maximum likelihood pattern scoring, whether tests are administered adaptively or as fixed forms. This approach is consistent with the Department's historical approach to scoring students assessments.

Plan for Early Return Equating Sample. AIR is the industry leader in sampling designs for large-scale assessments. The impact of sampling on test results can be substantial, but most testing companies overlook it. A smaller sample, randomly selected according to an appropriate sample design, provides better estimates of a population than a larger sample selected using ad hoc methods. Random sampling offers two critical advantages that have been the pillars of statistical science over the last century and a half:

- Random selection ensures that the probability of selection into the sample is independent of anything that might affect the target statistics, eliminating potential biases.
- Random selection yields estimates with known sampling properties, enabling statisticians to estimate accurate standard errors. With ad hoc sampling methods, accurate estimators for the standard errors are unavailable, and therefore the resulting statistics' reliability is unknowable.

The National Research Council's (NRC's) review of National Assessment of Educational Progress (NAEP) underscored the importance of appropriate variance estimates in testing. It determined that the reliability of NAEP estimates was overstated because they neglected to appropriately consider the standard errors of the item parameters (Pellegrino, Jones, & Mitchell, 1999). Shortly thereafter, the National Center for Education Statistics (NCES) contracted with AIR to develop estimators for the standard error of IRT item parameters under complex samples (Cohen, Jiang, Seburn, & Chan, 2008). These estimators are available through the *iAM* software, which AIR distributes without charge (Cohen & AIR, 2002)

The ability to accurately estimate standard errors of item parameters, linking constants, and other key statistics has benefitted AIR state assessment clients in important ways by providing

- a necessary mechanism to evaluate samples and refine sampling designs over time;
- a state-of-the-art basis for evaluating the equating error of the different forms used over time;
- key measures of linking errors used in evaluating alternate approaches to developing vertical scales; and
- the basis for evaluating (and subsequently revising) long-standing procedures for dropping linking items used in equating.

AIR will provide sampling plans to the Department for any activity in which sampling is required, including early return samples for equating analyses, as well as stand-alone field-test samples to field test items that cannot appropriately be embedded in operational test forms. Our proposal to compute test scores based on pre-equated item-parameter estimates would eliminate the need for drawing an early return sample, although even if the Department ultimately transitions to immediate scoring and reporting, an early return equating sample may still be required for the first operational test administration.

Concurrent Calibration for Multiple Form Assessments. For assessments in which multiple forms are administered, including Algebra 1, Algebra 2, and Geometry, rather than separately equating each form to the reference scale, the Department prefers to concurrently calibrate items across the multiple forms and then equate the linking items back to the reference scale. This approach is desirable because it increases the number of linking items used to equate test forms, yielding more reliable linking constants. This approach is strengthened by a robust common item linking design for the multiple forms.

Braille Forms. Following principles of universal design, test items will be constructed so that all accommodated forms, including Braille, will be as nearly equivalent to items administered to the general education form as possible, thereby allowing student scores to be computed using the same parameter estimates and scoring rules applied to the general education population. There could be some items that are deemed critical for the assessments but which cannot be rendered in Braille. For those administrations, the item can easily be dropped or replaced. Because test scores are computed using MLE, there is no need to produce separate scoring tables for administrations with dropped or replaced items.

7.6.1.2 Retake Assessments (Scaling, Equating, and Scoring)

Retake assessments are designed to be scored using pre-equated item-parameter estimates. As described in Section 7.3.7 Constructing Test Forms, retake assessments will be constructed following the same test specifications as census test forms. Should the Department elect to provide the FSAs as an adaptive assessment, then retake assessments will be administered and scored using the same procedures and configurations driving the census test administrations. The test delivery system tracks for each student the items previously administered and will not administer to students previously administered items. Thus, each test administration, whether census or retake, will provide an independent assessment of student achievement that meets complex blueprint requirements and targets test information near each student's ability. Scoring based on pre-equated item parameters allows for immediate scoring of test results for tests that do not require hand scoring.

Scoring based on pre-equated parameter estimates supports immediate reporting of test results for online fixed-form administrations as well. As discussed previously, there are some items that are not amenable to embedded field testing in operational test forms. Because the

Department has traditionally used a post-equating approach to scoring test administrations for census administrations, this has not posed an issue because such items were recalibrated and equated to the reference scale following operational test administration. However, while it may be the case that item-parameter estimates based on operational test administrations are preferable, scoring based on pre-equated item parameters from a well-designed stand-alone field test, including a robust linking and sampling designs, results in accurate and reliable parameter estimates that provide valid test scores. Modifying test specifications for retake assessments would seem to pose a greater threat to the validity of test score interpretations.

As we have described previously, AIR has developed machine-scored item types that can support a wide array of constructed responses, including natural language and essay-scoring engines. Especially for essay items scored using statistical algorithms, AIR recommends that final scores await verification of machine scoring by human raters or that final scores be rated by hand with machine scores serving as a second read. In either event, preliminary scores can be provided immediately upon completion of the test administration, with a note that scores are provisional upon verification by hand scoring.

7.6.2 Scaling, Equating, and Scoring (Psychometrics)

As we describe throughout this proposal, although we propose to continue the Department's post-equating approach to scoring paper-based assessments, AIR recommends that tests administered online be scored using pre-equated item-parameter estimates to support immediate reporting of test results to students and educators. The item banks from which we propose to develop the initial Florida assessments were designed to support computer-adaptive test administrations, including items calibrated under operational testing conditions. Should the Department elect to deploy an adaptive assessment system, the banks are ready to support an immediate transition. The Department may also choose to maintain a fixed-form design for the online assessment system. In that event, the pre-equated item parameters could be used to support immediate scoring and reporting of test results in the first operational test administration, or the Department could choose to recalibrate the items following the first operational test administration to produce a reference scale unique to Florida, with score reporting in the first year delayed until after performance standards are identified following the standard-setting workshops. For tests administered online, we recommend against the continued use of post-equating following the base-year administration, because the costs of reporting delays outweigh any minor benefits of post-equating. Nevertheless, we are prepared to support a post-equating design should the Department continue to maintain that tradition.

Even after assessments move online, some students will continue to be administered paper test forms as an accommodation. For these assessments, machine-scored items from the online pool, where possible, will be rendered as paper items, and student's responses will need to be hand scored. Machine-scored items that cannot be rendered on paper forms will be replaced by available constructed-response item types measuring the same strand, and responses to these items will also need to be hand scored. Although the paper-based test administrations will not be immediately scored and reported, the sample of students administered the paper-based accommodations will likely be too restricted to support post-calibration of item parameters. And possible differences in the performance of items across mode may caution against simply applying bank item

parameters to score paper-accommodated forms. Therefore, following the first online test administration, AIR proposes to conduct a matched samples mode comparability study to a) identify whether there are significant effects of mode on item-parameter estimates, and b) identify the linear transformations necessary to place the paper item parameters on the online scale. Should any identified mode effects be negligible (i.e., within measurement error), the Department may choose to simply score responses to paper-accommodated forms using online bank parameters. In the event of substantial mode differences, however, the Department may choose to apply the mode-based linking constant to the online item parameters to create a set of mode-adjusted item-parameter estimates for scoring responses to paper-accommodated test forms.

AIR will provide to the Department a set of specifications covering test construction, item analysis, and test scoring. Descriptions of the IRT models used to calibrate test items, equating procedures used to link items back to the reference scale, and scoring computations will be provided as part of the analysis specifications document that will guide all calibration, equating, and scoring analyses. AIR will also generate and provide to the Department and its quality assurance (QA) contractor(s) simulated data files for use in conducting dry runs for all calibration, equating, and scoring activities. The simulated data files will be provided in the same format that operational test data will be provided to the Department.

The Department intends that all calibration, equating, and scoring, including dry run and operational analyses, will be independently replicated by the Department and its QA contractor(s). AIR works closely with multiple QA contractors across our state assessment projects to provide the highest quality psychometric services to our clients. In some cases, the QA contractor is considered an extension of the client and all deliverables are provided simultaneously to the state department of education and the QA contractor. Other clients prefer provide the QA contractor with materials directly. We are prepared to adopt any strategy the Department wishes to ensure that all psychometric activities are thoroughly vetted and conducted without error.

Immediately upon completion of post-equating activities, AIR will produce a technical report documenting all post-equating procedures and analysis results for review by the Department and its Technical Advisory Committee (TAC). The equating technical report describes the post-equating sample and the procedures for analyzing student responses from this sample. It also presents results comparing classical item analysis statistics between field-test and operational-test administrations, operational-item calibrations and linked item-parameter estimates, application of cut scores, rounding rules, and scaled-score transformations to produce student test scores. In addition, test and subscale-level statistics are presented. The equating technical report will includes the following sections:

- Equating sample, including description of any exclusion rules
- Classical item analysis, documenting statistical procedures and comparing field-test and operational-test item statistics
- Item calibration and equating, describing procedures for calibrating operational-test items and placing item parameters on the base-year reference scale
- Documentation of cut scores, rounding rules, and linear transformations necessary to produce scale scores from linked operational item parameters
- Subscale-score analyses, providing classical test statistics for content standard scores,

intercorrelations among content standards, and reporting rules for content standard performance levels;

- Performance outcomes, including test score means and the percentage of students at each performance level for each subject area, for the total population and disaggregated by gender, ethnicity, and district type;

7.6.2.1 Scaling and Equating Team

AIR proposes a psychometric team to support the development and implementation of the Florida assessments that has extensive experience in statewide assessments with requirements almost identical to those called for in the INT, including administration of dual mode assessments, calibration 3PL and 2PL/GPC IRT models, TCC equating using Stocking-Lord, and MLE scoring of student tests.

Dr. Ahadi leads AIR's operational psychometricians in performing analyses, writing technical reports, and conducting validity studies for the Ohio and Minnesota statewide assessments. Dr. Ayers has supported Minnesota on the MCA and Modified assessments for the past 2 years. Drs. Ahadi, Ayers, Stephens, and other AIR psychometricians use a range of IRT models across assessment projects, including Rasch/Masters' Partial Credit models and the more general 3PL and 2PL/GPC models. For the more general IRT models employed, AIR psychometricians use Multilog and IRTPRO as the official platform, but AIR psychometricians also replicate analyses on our own *iAM* platform.

7.6.2.2 Selection of Calibration Samples

For assessments that have not yet transitioned to online, we expect that the Department will wish to maintain their post-equating approach to scoring. Although there are many important advantages to adaptive testing, including not only increased measurement precision for low and high ability students but also far greater coverage of the content domain at aggregate levels of analysis to support evaluation of classroom, school, and district accountability, we recognize that the Department may nevertheless wish to maintain a fixed-form assessment system. Moreover, while Florida may ultimately choose to score tests using pre-equated item parameters to support immediate reporting of test results, the preference may be to establish a Florida reference scale in the base year. Thus, selection of calibration samples each year remains a critical assessment tasks.

At the beginning of each school year, AIR will provide the Department with an early return sampling plan that details the procedures used to draw the equating samples and documents the characteristics of the drawn samples. Although we will draw early return samples for both paper and online assessments, we propose to use all available responses to machine-scored items for equating, since these will be available immediately upon close of the test window. Differences between the approach for paper and online assessments is described below.

Paper assessments. For subjects and grades in which paper is the primary test administration mode, post-equating analyses will proceed along a path consistent with the Department's past practices. At the beginning of each school year, AIR will draw a stratified random sample of schools designated for early processing of student answer documents. Typically, we employ color-coded shipping labels to differentiate early return schools, and return shipments from these schools are directed for immediate processing by DRC. Because the equating sample drawn by AIR is not a sample of convenience, accurate and reliable item parameters can be obtained with representative samples of approximately 10% of the

schools in the state. However, we note that the Department prefers that approximately 65% of state school be designated for the equating sample.

Online assessments. For assessments that are administered online, there are a variety of approaches available to the Department, including tests comprising

- machine-scored items only (except for Writing);
- machine-scored items with hand-score verification of target constructed-response items for a sample of responses;
- some constructed-response items that are hand scored only (Smarter Item Bank).

Each option has implications for the scoring and reporting of student test scores. Should the Department elect to administer only machine-scored items, item and test scores would be available for analysis immediately upon close of the test window. Even for those items requiring rubric validation, samples of student responses for the rubric validation process can be pulled prior to the close of the assessment window, allowing time for rubric validation committees to meet, revise rubrics as necessary, and allow for rescore of test items following the close of the test administration window. Thus, calibration and equating of all machine-scored items, including selected- and constructed-response, will be based on all online test administrations.

The Department may also wish to verify the performance of machine-scored items by hand scoring a 10% sample of student responses to targeted constructed-response items. Ideally, this approach would be implemented as part of field testing, so that items with unacceptably low rates of agreement between machine and human scores could either be dropped or have the machine-scored rubrics revised. Because we anticipate that the Department is likely to recalibrate items banks following the first operational test administration, this approach could be used to verify machine-scoring rubrics for a sample of constructed-response items prior to the calibration and equating activities in the first year and then carried forward on field-test items in subsequent years, allowing for immediate scoring and reporting of test results should the Department adopt that approach.

Finally, the Department may elect to administer items that must be hand scored. In this case, the Department could choose to withhold any score reporting until after hand-scoring activities are completed. In the case of delayed reporting, the Department would likely also likely maintain a post-equating approach to scoring student test records. We do note that immediate reporting of preliminary results could still be supported, because even though the test record is not complete, ability estimates would nevertheless be quite stable. However, because test scores would likely change, even if only by a small amount, issuing preliminary scores under this approach might be less desirable.

The early return equating sample for items administered online will be used only to expedite the processing of a representative sample of hand-scored items for equating. Because tests are administered online, with images captured and routed for scoring online, AIR can draw a simple random sample of students statewide for early processing. Because simple random samples are most efficient, immune to the effects of clustering due to similarities among students in classrooms, schools, and districts, the equating samples for hand-scored items administered online can be much smaller than equating samples based on the selection of schools.

7.6.3 Technical Oversight and Special Studies

In the following sections, we discuss technical oversight and assistance AIR will provide for all aspects of the assessment program described in the ITN and for the transition to the Florida Standards Assessment (FSA).

7.6.3.1 Contractors' Role

AIR is proposing highly qualified psychometric staff. The Department will work with the following lead psychometric staff:

- Dr. Gary Phillips leads the Psychometrics and Statistics team, which includes 14 lead psychometricians with Ph.D. degrees and more than a dozen statistical programmers, research associates, and other supporting staff. Dr. Phillips brings 26 years of experience, including running the National Assessment of Educational Progress (NAEP) for the federal government and serving as acting commissioner of the National Center for Education Statistics (NCES). Dr. Phillips holds a Ph.D. from the University of Kentucky, with an emphasis in statistics and psychometrics, and has published or presented more than 200 papers, taught dozens of advanced graduate-level statistics courses, and presented hundreds of workshops on advanced statistical and psychometric topics.
- Dr. Harold Doran, our proposed lead, will apply all of the Department-approved technical procedures, will have final approval over all analyses before submission to the Department, and also will lead or oversee the required studies. In addition to supporting the psychometrics of large-scale assessment programs in multiple states, Dr. Doran is an expert in value-added models, growth models, psychometrics, and state assessment policy. Dr. Doran has directed psychometrics in Oregon and Delaware and helped states complete studies needed for a successful assessment peer review with the federal government, including work for the District of Columbia, Delaware, Hawaii, Indiana, Michigan, Oregon, and Wisconsin. Dr. Doran was appointed by then-Secretary of Education Margaret Spellings to serve on the U.S. Department of Education's National Technical Advisory Committee.
- Dr. Elizabeth Ayers currently runs operational psychometric work for the Minnesota testing program, where she performs operational and field-test calibrations, conducts post-equating, and prepares materials for data review and standard setting. She is also responsible for updating analysis and scoring specification files as well as technical reports and summaries. Prior to joining AIR in early 2012, Dr. Ayers was a post-doctoral researcher at the University of California–Berkeley and received her Ph.D. in statistics from Carnegie Mellon University.

Drs. Phillips, Doran, and Ayers will be supported by other Ph.D. psychometrians, statistical programmers, and research staff from both AIR and DRC. Complete information on our staffing plan is presented in Section 7.7.2.

7.6.3.2 Technical Report

Technical manuals provide an important window into the inner workings of the testing program. They typically provide transparency that can assist states in their peer review with the U.S. Department of Education (DOE) and allow for users of the test scores to better understand the purpose and methods used for test construction. AIR routinely helps our state partners construct technical reports that provide the level of detail needed to respond to federal or other policy-related requests. Our typical approach in developing technical manuals is to ensure that all critical elements

found in the DOE Standards and Assessment peer review document are clearly and completely described in the reports.

The Florida ITN outlines the volumes that the vendor must produce; therefore, AIR will provide technical reports that conform to this approved outline established by the Department. Most of the sections are static and do not change over time, but a few of the sections present data on the tests administered for the year, and the statistics will vary with the compositionof the item pool and the proficiency of the students tested. The variable sections will be updated each year.

The outline provided by Florida is very comprehensive and covers virtually all details of the testing program. One area in which AIR would propose to extend the outline found in the ITN is if the testing program were to use an adaptive algorithm for any of its online tests. In such a situation, we would propose the following to augment the existing outline:

1. Description of the adaptive algorithm
    a. Objectives of the item selection algorithm
    b. Start/stop rules
    c. Delivery of field-test items
    d. Implementation of any test constraints

AIR's typical practice when implementing an adaptive test is to use our simulator tool, which delivers tests to simulated students in exactly the same way as the operational test to evaluate the behavior of the algorithm given the state item pool. This tool can project any possible issues and allow our psychometricians time before administering the test to resolve those issues. This section of the report will fully describe the results of the simulation performed before the test is operational.

2. Summary of simulation studies
    a. Bias
    b. Match to blueprint
    c. Projected item exposure rates
    d. Summary of standard errors

Other than these augmented sections, AIR will provide technical reports conforming to the structure of the outline as described in the ITN as follows:

A. Draft Technical Report Table of Contents

B. Background of Assessments

C. Item Development & Test Construction

- Item Development
- Item Review
- Field Testing
- Item Statistics
    - Classical Statistics
    - Item Response Theory Statistics: Difficulty, Discrimination, and Guessing
    - Differential Item Functioning (DIF) Statistics
    - Model Fit
    - Local Independence
    - Dimensionality (factor analyses, etc.)
- Test Construction

D. Administration

- Eligibility
- Administration Procedures
- Accommodations
- Test Security
- Data Forensics Program

E. Reports

- Appropriate Uses for Scores and Reports
- Reports Provided
- Description of Scores
- Appropriate Score Uses
- Cautions for Score Use

F. Performance Standards

- Setting Performance Standards
- Interim Performance Standards Florida Standards Assessments, ITN 2014-47 82

G. Sampling

- Rationale
- Procedure
- Representativeness

H. Scaling

- Rationale
- Measurement Models
- Scale Scores
- Scale Drift
- Vertical Scaling
- Checking IRT Assumptions (Model Fit, Local Dependence, Dimensionality, etc.)

I. Equating

- Rationale
- Pre-Equating
- Post-Equating
- Development Procedure for Future Forms
- Sources of Error Variances to Score Instability
- Linking Assessments During Transitioning Years
- Linking Assessments to Other Scales for Performance Comparison

J. Reliability

- Estimating Reliability
- Standard Error of Measurement
- Student Classification Accuracy and Consistency
- Reliability for sub groups in the population
- Reliability of year-to-year changes in school means

K. Validity

- Perspectives on Test Validity
- Criterion Validity
- Content and Curricular Validity
- Construct Validity
- Consequential Validity

L. Constructed-Response Scoring

- Scoring Process
- Quality Control
- Handscoring Reliability and Validity
- Rater Effects

M. Quality Control Procedures

- Quality Control for Test Construction
- Quality Control for Non-Scannable Documents
- Quality Control in Data Preparation
- Quality Control in Production Control
- Quality Control in Scanning

- Quality Control in Editing and Data Input
- Quality Control for Test Form Equating
- Quality Control in Scoring and Reporting Florida Standards Assessments, ITN 2014-47 83

N. Summary Statistics

- Item level statistics
- Test level statistics
- Review and comparison of raw scores, sub-scores, scale scores, distributions for total and sub-populations across years to monitor the trends across years and sub-populations
- Review and comparison of percent proficiency rates across years on different populations
- Frequency distributions of student achievement (all students and by sub-group) across years by grades and subject
- Scale drift indicators
- Correlations of student performance across the various subject areas tested

Item Analysis

This section of the ITN asks for the contractor to provide item level statistics for field-test items following the yearly test administration. Here we list the analyses that AIR will provide to the Department each year.

Item Analysis

Classical item analyses ensure that the items function as intended with respect to the underlying scales. AIR's analysis program computes the required item and test statistics for each multiple-choice and constructed-response item to check the integrity of the item and to verify the appropriateness of the difficulty level of the item. Key statistics that we compute and examine include the following:

- **Item Discrimination.** The item discrimination index indicates the extent to which each item differentiates between those examinees who possess the skills being measured and those who do not. In general, the higher the value, the better the item is able to differentiate between high- and low-achieving students. The discrimination index for multiple-choice items is calculated as the correlation between the item score and the student's IRT-based ability estimate. For polytomous items, we compute the mean total number correct for students scoring within each of the possible score categories. Items are flagged for subsequent reviews if the biserial correlation for the keyed (correct) response is less than .05.
- **Distractor Analyses.** Distractor analysis for the multiple-choice items is used to identify items that may have marginal distractors or ambiguous correct responses. In the distractor analysis, the correct response should be the most frequently selected option among high-scoring examinees. The discrimination value of the correct response should be substantial and positive, and the discrimination values for distractors should be lower and, generally, negative. The biserial correlation for distractors is the correlation between the item score, treating the target distractor as the correct response, and the student's IRT ability estimate, restricting the analysis to those students selecting either the target distractor or the keyed response. Items are flagged for subsequent reviews if the biserial correlation for the distractor response is greater than .05.
- **Item Difficulty.** Items that are either extremely difficult or extremely easy are flagged for review but are not necessarily

deleted if they align with the test specifications. For multiple-choice items, we compute the proportion of examinees in the sample selecting the correct answer (*p*-values), as well as those selecting the incorrect responses. For constructed-response items, item difficulty will be calculated both as the item's mean score and as the average proportion correct (analogous to *p*-value and indicating the ratio of item's mean score divided by the number of points possible). Items are flagged for reviews if the p-value is less than .25 or greater than .95.

Analysis of Differential Item Functioning

AIR conducts DIF analysis on all field-tested items to detect potential item bias across major ethnic and gender groups. The ITN indicates that the following DIF groups will be included in this analysis:

- Caucasian
- African-American
- Hispanic
- Gender

AIR will collaborate with the Department to identify any additional groups that may be considered for this analysis, such as students with disabilities.

Differential item functioning refers to items that appear to function differently across identifiable groups, typically across different demographic groups. Identifying DIF is important because sometimes it is a clue that an item contains a cultural or other bias. Not all items that exhibit DIF are biased; characteristics of the educational system may also lead to DIF. For example, if schools in low-income areas are less likely to offer geometry classes, students at those schools might perform more poorly on geometry items than would be expected, given their proficiency on other types of items. In this example, it is not the item that exhibits bias but the curriculum. However, DIF can indicate bias, so all field-tested items are evaluated for DIF, and all items exhibiting DIF are flagged for further examination by a Fairness and Sensitivity Committee. Committee members are asked to reexamine each flagged item, using the statistics as a guide, and to make a final decision about whether the item should be excluded from the pool of potential items given its performance in field-testing.

AIR typically uses a generalized Mantel-Haenszel (MH) procedure to evaluate DIF. The generalizations include (1) adaptation to polytomous items and (2) improved variance estimators to render the test statistics valid under complex sample designs. IRT ability estimates for each student on the test are used as the ability-matching variable. That score is divided into five intervals to compute the MH chi-square DIF statistics for balancing the stability and sensitivity of the DIF scoring category selection. The analysis program computes the MH chi-square value, the log-odds ratio, the standard error of the log-odds ratio, and the MH-delta for the multiple-choice items, the MH chi-square, the standardized mean difference (SMD), and the standard error of the SMD for the constructed-response items. The purification method described by Holland and Thayer (1988) is included in the DIF procedure.

Items are classified into three categories (A, B, or C), ranging from no evidence of DIF to severe DIF according to the DIF classification convention illustrated in Exhibit 7.6.3.2-1. Items are also categorized as positive DIF (i.e., +A, +B, or +C), signifying that the item favors the focal group (e.g., African American/Black, Hispanic, or female), or negative DIF (i.e., –A, –B, or –C), signifying that the item favors the reference group (e.g., white or male). Items are

Exhibit 7.6.3.2-1: DIF Classification Rules for Items

Dichotomous Items	
Category	**Rule**
C	$MH\chi^2$ is significant and $\lvert \hat{\Delta}_{MH} \rvert \geq 1.5$
B	$MH\chi^2$ is significant and $\lvert \hat{\Delta}_{MH} \rvert < 1.5$
A	$MH\chi^2$ is not significant.
Polytomous Items	
Category	**Rule**
C	$MH\chi^2$ is significant and $\lvert SMD \rvert / \lvert SD \rvert \geq .25$.
B	$MH\chi^2$ is significant and $\lvert SMD \rvert / \lvert SD \rvert < .25$.
A	$MH\chi^2$ is not significant.

flagged if their DIF statistics fall into the "C" category for any group. A DIF classification of "C" indicates that the item shows significant DIF and should be reviewed for potential content bias, differential validity, or other issues that may reduce item fairness. These items are flagged regardless of whether the DIF statistic favors the focal or reference group. A Fairness and Sensitivity Committee reviews all items flagged on the basis of DIF statistics. Committee members are encouraged to discuss these items and are asked to decide whether each item should be excluded from the pool of potential items given its performance in field-testing.

7.6.3.3 Transitioning from FCAT 2.0 and EOC Assessments to Florida Standards Assessments (FSA)—Linking the Scales

We understand that establishing the connection between the existing scales of measurement supporting the FCAT 2.0 and the new scales of measurement established for the new FSA assessment system is a key requirement specified in this RFP. Florida has the highest expectations for the technical analyses required for the development and implementation of the FSA. Moreover, we understand and accept the Department's demand that the technical quality of the FSA meet the *Standards for Educational and Psychological Testing* as well as best practices for high-stakes educational testing.

Given that the link between the scales of measurement defined for the FCAT 2.0 and the FSA must support student and school accountability requirements throughout the transition of the testing programs, the research design and associated methodology must be strong enough to produce a link between each assessment system across all units of measurement.

To connect the scales of measurement developed for the FSA and the existing scales of measurement supporting the FCAT, we will implement a common-item, non-equivalent groups design wherein different cohorts of students take a common set of linking items. In this case, linking items from the FCAT will be included within the initial FSA administration and the Stocking and Lord procedure (1983) will be used to estimate the transformation constants that define the link between the two assessments.

The Stocking and Lord linking method examines the squared difference between the TCCs

of the common items based on the provisional item parameter estimates and the established item estimates for those same items. For example, the TCC for a set of multiple-choice items from the provisional test can be defined as:

1. $\tau_x(\theta) = \sum_i P_i(\theta, a_{xi}, b_{xi}, c_{xi})$,

Where: $\tau_x(\theta)$ represents the expected raw score for a person at ability θ with item parameters expressed in the scale x metric, a_{xi}, b_{xi}, c_{xi} are the item parameters for item i on scale x, and θ is the IRT ability expressed on scale x, $\theta = -\infty, \infty$.

The TCC for the same set of items but in the scale y metric can be defined as:

2. $\tau_x(\theta) = \sum_i P_i(\theta, a_{xi}, b_{xi}, c_{xi})$,

A linear transformation with constants α and β can be used to convert the provisional scale x estimates into the established scale y metric:

3. $b_{yi} = \alpha\, b_{xi} + \beta$

4. $a_{yi} = a_{xi} / \alpha$

5. $c_{yi} = c_{xi}$

The transformation constants α and β are derived by minimizing the difference between $\tau_x(\theta)$ and $\tau_y(\theta)$. Stocking and Lord proposed the appropriate criterion function as follows:

6. $F = \frac{1}{N} \sum_{i=1}^{N} \left(\tau_x(\theta) - \tau_y(\theta)\right)^2$

where N is the number of examinees. This criterion function F is minimized when

7. $\frac{\partial F}{\partial \alpha} = \frac{\partial F}{\partial \beta} = 0$.

The solution for α and β is obtained iteratively and the transformation constants are used to transform the item parameter estimates on the provisional scale x to the existing scale y. This places all unique items onto the existing scale y.

We will conduct a rigorous evaluation of the each equating analysis implemented to develop the link between the FCAT and the FSA.

The Stocking and Lord procedure minimizes the mean squared difference between the two test characteristic curves, one based on estimates from the previous calibration and the other based on transformed estimates from the current calibration. The parameters for the linking items were previously estimated in a preceding FCAT administration, so we can check to determine whether the parameter estimates from the current year administration varies significantly from the prior obtained parameter estimates. Outlying items can be identified by plotting the input and estimated item parameters along with the line of best fit. We will employ different methods to evaluate linking items including scatter plot of the item parameters, *t*-test of the discrepancy of the item parameters, and/or Robust-Z statistics.

While the Stocking and Lord procedure is probably the most common linking method used in large-scale educational assessments, we will evaluate the consistency of the equating results based on Stocking and Lord with other commonly used methods such as: Mean/Mean (Loyd & Hoover, 1980), Mean/Sigma (Marco, 1977), Robust Mean/Sigma (Linn, Levine, Hastings, &

Wardrop, 1981), and another TCC method developed by Haebara (1980).

Additional Considerations

Selection of the Linking Items. The selection of linking items to support equating analysis within the common-items, non-equivalent groups design must be done carefully. To ensure that test scores on the new FSA are equated to the FCAT, and not simply calibrated, linking items should be representative of the FCAT blueprints and test forms. Ideally, items would be selected to represent a proportional length blueprint, with psychometric characteristics consistent with previous FCAT administrations. In addition, it is especially important that students have also had the opportunity to learn the content that is represented within the linking set when assessment systems are transitioning content standards such as the FCAT and FSA. Our test development and psychometric team will work closely with the Department to define the optimal set of items that will be used to link the FCAT and FSA.

Size of the Linking Set. Because representation of content is critical to test score equating, we recommend identifying the linking set as a previous FCAT operational test form. This ensures that the equating analyses are always based on a set of items that meets all blueprint and psychometric specifications for the FCAT, and in fact passed through all of the Department's review procedures for operational test administration.

Each student will only respond to a few of these items, which will be randomly distributed where field-test items might otherwise go. This matrix design provides a very strong linkage without changing the test length for individual students.

Should the Department choose to identify a smaller set of linking items, we will work with the Department to select a subset of items that represent a proportional length FCAT assessment. However, given Florida's large student population, embedding a form's worth of FCAT linking items should not pose a problem.

7.6.3.4 Implement Achievement Level Standard Setting Meetings

Plan for Setting Performance Standards

Performance standards in Florida play a central, high-stakes role in the state accountability system. The performance cuts have at least the following important roles at the state level, with some other potential high-stakes uses as chosen by individual districts:

- Students must score at or above performance level 2 in Reading to be promoted to grade 4.
- Students must score at level 3 on the high school Reading and Mathematics tests in order to graduate.
- The A+ school grades are based on the percentage of students meeting high standards and the percent of students who make learning gains.

In Section 7.6.3.6 we describe validity studies that will evaluate the inferences needed to support these uses. These validity studies will yield information that might prove useful as feedback for standard setters. For example, a validity study occurring for Student Assessment of Growth and Excellence (SAGE) will identify the point that best discriminates between college freshmen in need of remediation from college freshmen taking standard courses in good standing. The Department may consider including data from these and

other validity studies as input to the standard-setting process.

We also recognize the timeline challenge faced by Florida. In May, Florida will need to report scores on which very high-stakes decisions will be based. Grade 3 students may be retained, and high school students may not pass their graduation test. This poses a critical challenge. Florida will require valid standards against which these judgments can be made, but will have no time to establish these standards after testing.

The proposed item banks each have the data that Florida will need to establish fair standards that are suitable for these purposes, so Florida will be able to conduct standard setting prior to using the items to build the first form of the FSA. Through approximate linkages to other states, standard setters will have a rough idea of the percent of Florida students who will fall into each performance category, though the prediction will not be as precise as it would have been had the test been given in Florida. (We do offer an option for Florida to participate in a SAGE field test this spring to get direct Florida-specific data.)

Because the standards play a critical role in both student and school accountability, it is important that the standards represent rigorous yet realistic levels of achievement for all students. We propose that there must be at least three criteria in place to guide the development of standards well suited to the purpose the Department intends to use them for:

1. Students must be provided with an **opportunity to learn** the skills being tested. As such, the performance standards must reflect achievement relative to the Next Generation Sunshine State Standards—the state enacted curricula.
2. The standards must be **attainable** such that well-deserving students are not inadvertently retained because the grade 3 or high school test performance cuts were set to inappropriately high levels.
3. The standards must be **credible and rigorous**. Benchmarking against other state and international tests, inclusion of data generated by the validity studies, and stakeholder reviews of the performance cuts prior to state board adoption are well suited to this purpose.

Timeline for Standard Setting

Though our proposal includes options to use either the SAGE or Smarter Balanced assessment items, our proposal recognizes that Florida must set its own performance standards given the unique ways in which the performance cuts are used for accountability. For this reason, our proposal offers an accelerated approach for standard setting that will allow the state to fulfill its reporting and accountability objectives with no delay and no impediments to the opportunity to learn for students.

Our recommendation is to complete the standard setting workshops during summer 2014 with ordered item booklets based on the item parameters from either the SAGE or Smarter Balanced field-test data. If this option is chosen as we recommend, the state will be able to immediately score students following the spring 2015 operational assessment. This proposed approach will provide the state with the following:

- Immediately determine whether grade 3 students meet the level 2 cut for promotion or retention and inform students of the decision.
- Allow the state to complete analyses needed for its A+ school grades program and other analyses necessary to satisfy agreements with the U.S. Department of Education's accountability workbook.

- Allow high school students to immediately learn whether they have received passing grades on the end-of-course tests. This is critically important for the subset of students taking the end-of-course tests later in their high school careers. Some students in grade 12 take these tests, though this is rare, and unless performance cuts are immediately available as we propose, it would not be possible to know whether these students scored at level 3 or above before graduation as required by the state.

If standard setting is delayed until summer 2015, the high school graduation requirement and the grade 3 reading guarantee will have to be put on hold for one year. No externally established standard would likely prove sufficient to support these uses in Florida. AIR will be pleased to conduct the standard setting at either time. Florida may consider setting the standard early and conducting a confirmation study after the first administration.

An option AIR can also support, and has implemented in other states, is to perform a confirmatory standard setting meeting during summer 2015. If chosen, AIR could use the post-equated item response data from the spring 2015 administration and recreate the ordered item booklets using the updated item parameters. A subset of the standard setting committee could reconvene and verify the cuts previously established during summer 2014. This option is not included in our base cost.

Technical Approach

Our technical proposal in this section describes our proposed use of the bookmark method of standard setting and provides details on our plan for implementation. The preceding three criteria are embedded throughout our proposed technical approach, allowing for reviews and input from multiple audiences with varied levels of experience and expertise.

AIR's plan for recommending performance standards ensures that cut scores for grade-level assessments are vertically articulated, so that any changes in percentage of students scoring at or above the proficient level can be meaningfully tied to maturational or instructional differences between grade levels, rather than an idiosyncratic difference between recommended performance standards across grade-level panels. Moreover, AIR recommends that panelists be provided with national and international benchmark data as well as "other state" benchmark data to provide greater context to the meaning of statewide assessment scores and to encourage panelists to recommend performance standards that are nationally and internationally competitive and competitive with other states with a similar curricular structure.

Our proposed plan for test development would directly provide for the other state data linkages required if either Smarter Balanced or the SAGE test is selected. The specifics of our plan to provide the benchmark data for other state and international benchmarks are described in Sections 7.6.3.6.2 and 7.6.3.6.3.

Bookmark Procedure. To ensure vertically articulated performance standards across grade-level assessments, AIR proposes to employ a modified bookmark procedure (Mitzel, Lewis, Patz, & Green, 2001) to establish cut scores for the Florida statewide assessments. In the modified bookmark approach, AIR convenes standard-setting panels by grand bands (e.g., grades 3–5, 6–8, and 9–11). Panels begin by recommending performance standards in anchor grades (e.g., 4, 7, and 10), using the standard bookmark method. Following recommendation of cut scores for the anchor grades, panelists convene to vertically articulate performance standards across

the anchor grades. Once recommended cuts scores for the anchor grade have been established, AIR then interpolates the location of performance standards in the remaining grades. With interpolated cut scores in hand, the judgment task for panelists is modified so that panelists are now asked to judge whether, for each interpolated cut score, two-thirds (RP level) of just-barely-meet-the-standard students would be expected to successfully respond to the item. If the judgment is yes, panelists are asked to endorse to explicitly take into consideration the important goal of recommending vertically coherent performance standards when making bookmark placements. AIR has successfully used this modified bookmark method to recommend performance standards for other state assessments.

Augmenting Ordered-Item Booklets. Although we would ideally like to recommend performance standards on the bank of items that make up each statewide assessment, such an approach would be too cumbersome for standard setters. Recommending performance standards on a single operational test form, however, is often too restrictive, requiring panelists to recommend performance standards based on a highly constrained sample of items that cannot represent the range of content standards and benchmarks across the spectrum of student achievement. We therefore recommend using an augmented ordered-item booklet (OIB) to recommend performance standards. We propose to construct an OIB that is proportional to the blueprint but contains more items than any one operational test administration. Augmenting the OIB in this way helps ensure that standard setters are making judgments on a more representative range of the content standards assessed. Augmenting the OIB also helps ensure that there are sufficient items in the higher and lower ability ranges to support bookmark placements for cut scores at the higher and lower performance levels. For example, when the OIB is constructed from a single operational test form or administration, it is often the case that moving the bookmark placement by even one page can have an outsized impact, and panelists are reluctant to make bookmark placements based on content considerations when shifting the placement of a bookmark by even one page can result in 5% or more additional students not meeting the standard. Augmenting the OIB modulates the impact of bookmark placements in the higher and lower ability regions, freeing panelists to focus on content considerations when placing bookmarks.

Workshop Panelists and Stakeholder Review Committees. While it is critically important to include a range of stakeholders in the standard-setting process, our experience has shown that it is essential for panelists to have direct knowledge of academic standards and student grade-level performance to participate meaningfully in the bookmarking process. For this reason, we propose to restrict panel participation to classroom teachers and curriculum specialists with expertise in the subject area content for each assessment. Additionally, these experts are the most familiar with the enacted curricula and can make qualitative judgments regarding the degree to which students have had the opportunity to learn the material.

To ensure that the widest range of stakeholders has meaningful input into the standard-setting process, we propose to conduct a "reactor" review and moderation session with a more general group comprising table leaders from the bookmark workshop and representatives from other important stakeholder groups, including members from the educational community, such as building and district administrators, local school board members, and faculty from higher education. We also propose including members from outside the educa-

tional community, including parents and business and community representatives.

The reactor meetings will be structured to allow for stakeholders to review all cuts but to have a particular emphasis on the review of cuts that are directly used in high-stakes accountability (e.g., the Level 2 cut for grade 3 promotion). Stakeholders will be provided with the impact data as well as written justifications describing why the high-stakes cuts are attainable and rigorous representations of what students should know and be able to demonstrate in the affected grades.

Performance-level descriptors (PLDs) define the content area knowledge, skills, and processes that test-takers at a performance level are expected to possess. The standard-setting panelists will base their judgments about the location of the achievement levels by using the PLDs as well as the Florida Next Generation Sunshine State Standards to guide them in placing their bookmarks.

AIR will work with the Department to draft appropriate PLDs. Prior to standard setting, AIR will work with the Department to create PLDs that are clear, concrete, and reflect the Department's expectations for proficiency. This process usually requires multiple rounds of review, revision, and collaboration. Particular emphasis will be placed on ensuring that the PLDs capture knowledge and skills that students have had the opportunity to learn prior to the test.

AIR will then convene panels of Florida educators to review and revise the PLDs. The PLDs jointly authored by the Department and AIR will be used as input for these meetings, and we expect that the panels of educators will fine-tune them. We will capture all comments and moderate the meetings to achieve consensus on all revisions. The proposed revisions will be documented and delivered to the Department. AIR will work with the Department to resolve all comments and make the approved changes.

Standard-Setting Materials and Procedures

Panelist Recruitment. For grade-level assessments, AIR will convene elementary, middle, and, for ELA, high school panels. For course-based assessments that require specific content expertise, AIR will convene a separate panel for each course-based assessment. As indicated in Exhibit 7.6.3.4-1, AIR will recruit approximately 15 panelists for each standard-setting panel to recommend performance standards. For grade-level assessments, this represents approximately five panelists per grade in each grade-band panel. To recruit panelists, we will actively seek individuals from the diversity of backgrounds found in Florida. We will seek the representation of males and females found in the grade- and course-specific teacher population of Florida. The same principle will be applied to the geographical representation of panelists. In addition, we will strive for proportional representation of racial and ethnic backgrounds as well as special education students and English language learners.

Exhibit 7.6.3.4-1: Standard-Setting Panels and Panelists

Panels		Panelists
ELA	Elementary (3–8)	15
	High School (9–11)	15
Math	Elementary (3–8)	15
End-of-Course	Algebra I	15
	Algebra II	15
	Geometry	15

Training. An essential element of a standard-setting workshop is thorough training. Training at the meetings will involve helping panelists become familiar with the assessment system and the standard-setting process. The training will include a review and discussion of the assessments, the test specifications, the Florida Next Generation State Sunshine Standards and the PLDs for each performance standard.

Table leaders will have the additional responsibility of ensuring that table activities remain focused on the task at hand, ensuring that panelists understand the task and alerting workshop leaders of any issues encountered by panelists as they engage in their workshop tasks. Table leaders are not expected to provide training to panelists. Instead, they serve as liaisons between the panelists and workshop leaders to ensure that workshop activities are implemented correctly, alert workshop leaders of issues that may arise during the course of conducting workshop activities, and represent the table in the stakeholder deliberations. We will convene a table leader orientation meeting prior to the standard-setting workshop to familiarize table leaders with their role and responsibilities, including suggestions on how to provide leadership at the tables during the standard-setting process and how to manage the secure materials.

Central to their training, panelists will use the PLDs to develop a representation of students who just barely meet each of the PLDs. During this training task, panelists learn that although PLDs are written to characterize typical members of each achievement level, their bookmark placements will be directed toward characterizing and identifying the most minimally qualified members of each performance level. Characterizing students who just barely meet expectations is not an intuitive judgment, and panelists are encouraged to spend time discussing with one another the minimum characteristics of student achievement for entry into each performance level.

Finally, panelists will receive training in the placement of bookmarks in the OIBs. As part of this training, panelists learn to place a bookmark between the two items that best delineate two achievement levels (e.g., between items on which students must demonstrate mastery to meet the minimum requirements for the proficient level and those items on which demonstration of mastery is not necessary). In addition to showing panelists how to place bookmarks in the OIB as part of the large-group training, AIR will provide sample OIBs to panelists so that they can practice placing bookmarks in the OIB.

Bookmark Placement. Following training in the bookmark procedure, panelists will receive anchor grade OIBs. For each item in the OIB, panelists will be instructed to ask what a student must know and be able to do to answer each question and what makes each item in the OIB more difficult than the preceding item. This review of the OIB allows panelists to gain new perspectives on the knowledge and skill requirements of items and to share information regarding their thoughts on the location of the threshold region. During this discussion, the workshop leader will circulate through the room to monitor progress, assist panelists who are having trouble with the task, and answer any questions.

Using the PLDs as a guide, panelists will then be instructed to place a bookmark between the pages in the OIB that best delineate each of the performance levels, beginning with the proficient level performance standard. Once panelists feel comfortable about their proficient level cut, they will move on to place bookmarks for the other performance standards. Bookmark placement is conducted in two rounds, allowing panelists to make independent judgments while still benefiting from

discussion with their fellow panelists. The placement of the bookmark is illustrated in Exhibit 7.6.3.4-2. Each panelist uses the PLDs and the content standards to decide which item represents the lower bound of each achievement level. In the example, a panelist concludes that students who are just barely at the proficient level would demonstrate mastery on the item on page 25, whereas students below the proficient standard would not. Therefore, the panelist decides that the proficient level performance standard begins on page 25. The panelist believes that students below the proficient performance level will not be able to demonstrate mastery of items beyond those on page 24 in the OIB.

Feedback and Impact Data. Prior to round two, AIR psychometricians will evaluate results from round one and provide feedback forms for each table and for the room as a whole. The forms for each table contain summary statistics showing the median, lowest, and highest cut scores for that table. The room form contains summary statistics showing the median, lowest, and highest cut scores for each table. In addition, an impact data sheet containing scale scores and the percentage of students at or above the level for each possible cut score are provided to panelists for reference and discussion.

Round two begins with a discussion of two types of information:

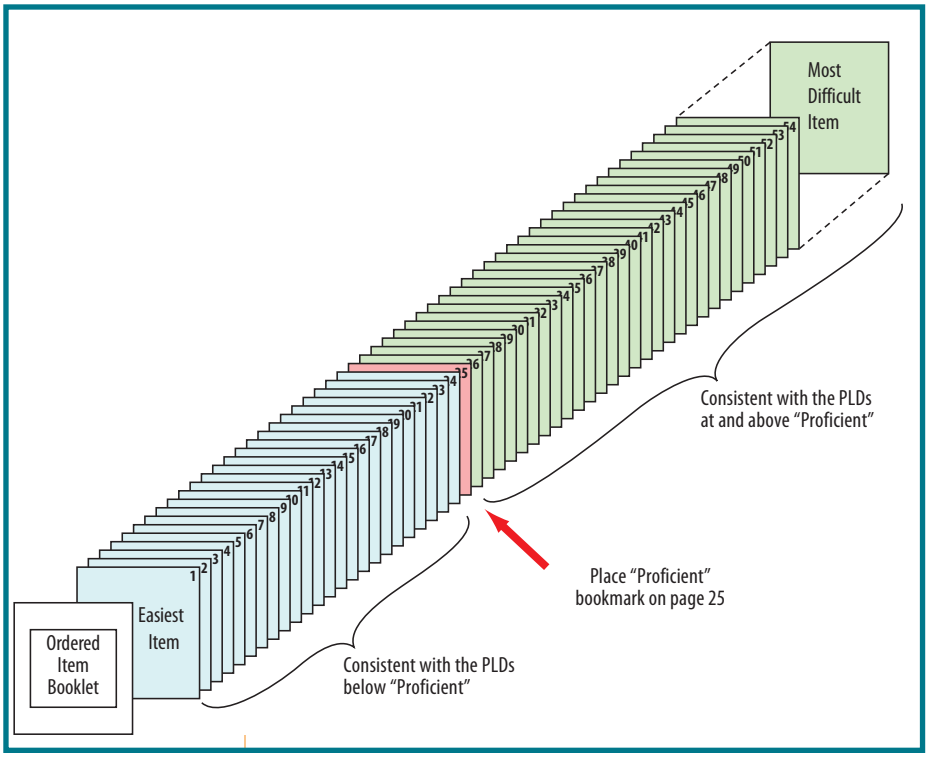
1. Feedback on agreement data, beginning with table-level feedback and discussion and progressing to room-level discussion
2. Impact data (scale scores and percentage at or above each cut score) from the operational test administration

Each table spends time reviewing and discussing cut score placements, focusing on the lowest and highest recommended cut scores and the table's median score. Panelists review the items between the lowest and highest cut scores for proficiency at their table, discussing the PLDs, as well as the newly introduced impact data. Discussion then expands to the room level, with each table reviewing the basis for its own recommendations for the group at large.

After completing these discussions, panelists again work through the OIB, placing their cut scores for all three performance levels.

Vertical Articulation and Moderation. Following the recommendation of performance standards for the initial grades, we propose to conduct a moderation session comprising table

Exhibit 7.6.3.4-2: Example of Bookmark Placement



leaders from each of the panels. Although all panelists will be allowed to attend the moderation sessions as observers, participation will be limited to table leaders to effectively manage moderation session activities. The task of table leaders in the cross-grade moderation session will be to evaluate whether the recommended performance standards are reasonable across all grade levels assessed and to make modifications to the location of the standards if necessary.

To recommend performance standards in the intermediate grades, we modify the traditional bookmark procedures so that panelists are instructed to determine whether the PLDs support the placement of a specific bookmark on the interpolated page. If the PLDs do not support the placement of the bookmark on the interpolated page, panelists are asked whether they can identify a bookmark placement near the interpolated page that would be supported by the PLDs. Panelists are instructed that their bookmark placements must be guided by content considerations, regardless of whether they recommend the interpolated page in the OIB or another bookmark placement.

Stakeholder Reactor Review and Moderation. To achieve a coherent set of standards across the system of statewide assessments that reflects the input of a wide range of stakeholders, both within and outside the education community, AIR will convene the workshop table leaders and stakeholders for the purpose of evaluating the performance standards recommended by the panel and smoothing the cut scores to achieve a coherent system of standards across grades. Stakeholders and table leaders will have the opportunity to offer additional recommendations on the proposed standards to the Department.

Workshop Staffing. Each workshop panel will be staffed by an AIR senior workshop leader, a content specialist, and a research assistant. In addition, AIR psychometricians will be available to record panelists' decisions, provide feedback to the workshop participants, and draft the technical report. The room and all workshop materials will be kept secure as determined by a nondisclosure agreement, and a research assistant will make sure that no secure materials are taken from the room.

AIR staff will arrive one day early for the meeting to set up equipment and distribute materials. AIR staff will also be on-site for one day after the workshop to clean up the site, shred secure documents, and prepare statistical results for the standard-setting technical report.

Evaluation. Panelists will have the opportunity to provide feedback concerning the procedures and outcomes of the standard-setting workshop through group discussions and a series of standardized evaluation forms. Panelists will be asked to evaluate aspects of the standard-setting process throughout the workshop; these interim evaluations will inform workshop facilitators about the readiness of the panelists to recommend performance standards and allow workshop leaders to address issues that may arise, including, for example, the need for additional time or training.

Prior to placing recommended cuts in each round and for each performance level, panelists will be asked to complete a readiness form to indicate their preparedness to place their OIB bookmarks. This form will also ask panelists to identify any aspects of their task that are not clear. If any panelists indicate that they do not feel prepared, the workshop leader will provide additional training and opportunity for discussion. Panelists must indicate that they feel ready to move forward before they recommend a cut.

At the completion of the workshop, panelists will be asked to complete an evaluation form

designed to elicit feedback on all aspects of the workshop, including clarity of training and tasks, appropriateness of the time spent on activities, and satisfaction with the outcome of the workshop. Appendix E presents a sample of a panelist evaluation form.

Results of these evaluations will be summarized and presented in the standard-setting technical report.

Technical Report. AIR will provide a comprehensive standard-setting technical report that will be available for review by the Department and the Technical Advisory Committee (TAC). It will detail the procedures, participants, and other relevant elements. The standard-setting technical report will be specifically oriented toward providing the type of comprehensive details required by NCLB peer review. The report will contain these sections:

1. Executive Summary, which is written for policymakers and can be used by the Department for workshops and provided to the Florida Board of Education
2. Background and history of Florida's statewide assessments
3. Preparation for the standard-setting workshop, which covers the development of the PLDs, psychometric details of the field test, item calibrations and the creation of the vertical scale, estimation of impact data, explanation of the articulation process and international benchmarking procedures, and the composition and demographics of the standard-setting panels
4. Conduct of the standard-setting workshop, which includes agendas, training procedures, details of the round one and round two estimates of cut scores, stakeholder review and moderation sessions, security procedures, and evaluation
5. Results of the standard-setting workshop, which include summaries of each round, reliability of the achievement-level standards, changes in cut scores resulting from the stakeholder review and moderation sessions, final cut scores, and the percentage at and above each achievement level.

In addition, AIR will assist the Department with any materials or any other assistance needed for the Florida Board of Education's approval of the standards.

7.6.3.5 Vertical Scaling

Vertical Linking Background

AIR's proposed plan for establishing a vertically linked scale in reading and math is described in this section. Our proposed approach for Florida is to adopt the vertically linked scale constructed for either the SAGE or Smarter Balanced tests. Both of those scales were established using a representative sample of items from adjacent grades using a common item, non-equivalent groups approach (Kolen & Brennan, 2004). In both instances, items were administered to students using AIR's distribution algorithm, which ensures a random, representative sample of responses from students.

If Florida chooses fixed forms for all tested grades rather than adaptive and also implements post-equating, then those scores will be linked back to the scale using the Stocking-Lord procedure (1983) as described in this section.

AIR's Experience with Large-Scale Vertical Linking

We understand that the vertical scale required for Florida will be used to measure growth and "value-added" as described in the state ITN. AIR has experience both in the construction of vertical scales for large-scale state testing programs as well as in developing growth models

for accountability, particularly using the Florida developmental scaled scores for the state value-added model.

Exhibit 7.6.3.5-1 lists the states where AIR has developed vertical scales for large state testing programs. Our experiences in each state are similar in that our process begins with a proposed plan that is reviewed by state Technical Advisory Committees (TACs) and revised as needed before implementation. Additionally, AIR typically implements multiple ways to statistically link the results such that our state clients can evaluate which approach provides results that are best suited to their reporting and accountability situations.

Using Growth Scales for Accountability

AIR is currently responsible for the value-added implementation in the State of Florida, which makes use of the current developmental scaled scores (DSS). We have also implemented growth/value-added models in other states and have identified certain limitations commonly used by psychometricians that restrict some students from demonstrating growth.

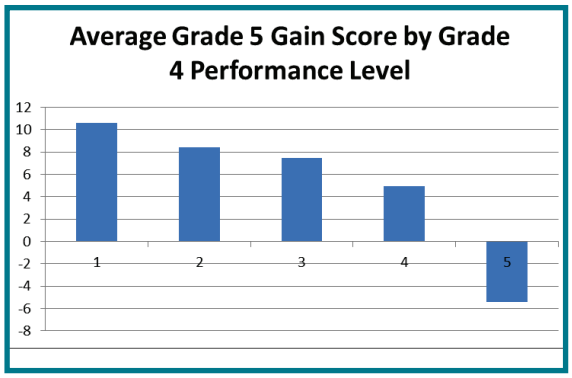
Exhibit 7.6.3.5-2 illustrates this issue, which is based on Florida FCAT 2.0 data from 2012–13. This bar graph shows the average grade 5 math gain score for students on the Florida DSS based on their grade 4 performance level. For instance, students scoring in performance level 1 in grade 4 have larger gains than students who started at any other performance level. Conversely, students scoring in performance level 5 in grade 4 showed negative gains from one year to the next.

To some degree, this result is related to mean reversion. The lowest performing students in the state in grade 4 are most likely to experience a large, negative draw from the error distribution and the highest performing students in grade 4 are those who are most likely to experience a large, positive draw from the error distribution. On a later retest, they are unlikely to receive the same large negative or positive draw, resulting in a score that pulls these students toward the middle of the score distribution. The result is a growth pattern that has limitations for use in accountability, as the negative gains for the highest perform-

Exhibit 7.6.3.5-1: States Where AIR Has Developed Vertical Scales

State	Vertical Scale	IRT Model	Linking Method	Grades	Purpose
Delaware	Reading and math	Rasch	Concurrent calibration	3–10	For reporting and accountability
Minnesota	Reading and math	3PL	Stocking-Lord	3–10	For reporting and accountability
Utah	Reading and math	3PL	Stocking-Lord	3–10	For reporting and accountability
Ohio	Reading and math	Rasch	Mean, Concurrent calibration	3–10	Research and used for standard setting verification of articulated standards
Washington	Reading and Math	Rasch	Mean/concurrent calibration	3–8	Research
Wisconsin	Reading and Math	3PL	Stocking-Lord/Concurrent calibration	3–8	Research

Exhibit 7.6.3.5-2: Average Grade 5 Math Gain Score in Florida, 2012–13



ing students suggest they declined in their academic progress, not improved.

This pattern is almost certainly not a true reflection of growth, but a reflection of two inherent issues that might be somewhat mitigated in scale development. First, if test forms can be constructed to minimize error variance at all points along the scale, then mean reversion for extreme scoring students would be reduced. Computer-adaptive testing is one option that minimizes error variance for students along the score continuum, and can be supported by both the SAGE and Smarter Balanced tests.

Second, a common psychometric practice that restricts growth is to *censor* the within-grade score scales—meaning that the lower and upper ends of the score scale are arbitrarily capped at a value. Psychometricians commonly refer to these as lowest obtainable scaled scores (LOSS) and highest obtainable scaled scores (HOSS). When the scales have artificial caps, it is entirely possible that a student's true score can be above the HOSS, but the censored score scales prevent that score from being reported. This would restrict a student from showing growth, especially for high-performing students who can score no higher than the HOSS.

Technical Approach to Developing the Vertical Scale

We propose to base Florida's vertical scale on the vertical scale established for the assessment with which the FSA will start—SAGE or Smarter Balanced. Both assessments use our randomized item-embedding algorithm to distribute vertical scaling items to students.

In this section we describe the ways in which the items from adjacent grades were selected to build the vertical scale for SAGE and Smarter Balanced and then describe how post-equated fixed forms can be linked back to the vertical scale if Florida were to choose that option.

Selection of Linking Items

The common-item non-equivalent groups design requires that a set of items are embedded into the pool to establish between-grade linkages. Though the vertical scale establishes only an approximation of the construct measured over time (e.g., grade 4 math is not just a harder version of grade 3 math), the linking set must represent the test blueprints for each grade to establish a content-relevant set of linking items.

From within each grade, a sample of items was chosen by content experts to adequately and proportionally reflect the common core test blueprint. Two types of items were chosen from each grade to serve in the linking set, which we refer to as upward-linking and backward-linking items. Upward-linking items are those drawn from the pool in grade g and are linked on forms in grade $g + 1$. Backward-linked items are those items selected from the pool in grade g that are then used as linking items in grade $g - 1$.

Stocking-Lord Procedure

The Department may opt for fixed forms for all grades and subjects using a set of items drawn from the available items pools established for SAGE or Smarter Balanced. In this instance, post-equating methods using the most recent Florida data would most likely be implemented, thus requiring the post-equated data to be linked back to the vertical scale. We propose to use the Stocking-Lord procedure (1983) to find linking constants that minimize the squared distance between two test characteristic curves. The method is applied to find linking constants between each grade pair when items within a grade are separately calibrated. The common items in this case would have parameters from the original vertical scale calibration and the new post-equated estimates.

The approach evaluates the following integral where the indices i denote an item and a and b denote separate forms:

$$SL = \int \left[\sum_{i=1}^{I} p(\theta; a_{ia}, b_{ia}, c_{ia}) - \sum_{i=1}^{I} p(\theta; \frac{a_{ib}}{A}, Ab_{ib} + B, c_{ib}) \right]^2 f(\theta) d(\theta)$$

Replication

The ITN calls for the vendor to replicate this study three years after the initial scale is developed, which may occur in the contract renewal period. AIR proposes to replicate the same methods implemented, as described in this section of our proposal, and compare the growth patterns observed between adjacent grade pairs between the initial and replicated vertical scales. Any new research or significant findings in the area of vertical linking that occurs after the initial scale is developed may be applied to improve on the initial work completed.

7.6.3.6 Scaling and Equating Studies

Scaling and Equating Studies

This section of the ITN lists several research studies that must be conducted to support inferences regarding scores as the state transitions to a new scale and a new mode of test administration. Here we provide our detailed responses to the studies listed specifically in the ITN, including the following:

- Effects of scale drift on score interpretation
- Comparability of scores using different devices
- Linking the new Florida assessment to other assessments measuring the same standards
- A study to link the new Florida assessment to international standards

We also provide as a separate cost option other validity studies that may be useful to support the goals of the state. These studies are not requested in the ITN, and for this reason, we propose them as optional studies AIR is prepared to implement for Florida if selected. These studies are centered on the high-stakes nature of the test scores and their uses in student-level promotion/graduation and the teacher accountability system using test scores.

The additional validity studies we propose focus on evidence needed to support the following uses of the test scores in the Florida accountability system:

- Evidence to support the use of the grade 3 level 2 cut score for determining student-level promotion decisions
- Evidence to support the use of the level 3 cuts as a graduation requirement for the end-of-course exams

- Evidence to support the use of the new scale scores to support continuity of the state value-added model program and gain scores used for the A+ accountability program

In the remainder of this section, we outline our responses to the studies listed specifically in the ITN and the additional, optional studies proposed by AIR.

Investigating the Effects of Scale Drift in the Presence of Equating Chains

The state accurately describes in the ITN the potential for multiple equating chains to conflate the meaning and interpretation of test scores with other factors that may cause the shift. The accumulation of random and systematic error from multiple equating functions over time may alter the interpretation of score inferences.

In the ideal scenario, changes in score distributions can be attributed to true changes in the ability of students in the population. Unfortunately, multiple other factors may be confounded with shifts in the score distributions, potentially impeding this ideal inference to be supported. Scale drift occurs when a specific score at time t, $\hat{\theta}_{i,t}$ has a different meaning and interpretation as $\hat{\theta}_{i,t'}$ when observed on a later test form.

Minimally, both equating error and changes in the trait measured may change over time, leading to differences in the interpretation of the scores. Haberman and Dorans (2009) provide a summary list of other sources that may contribute to the scale drift.

Effects of Equating Error on Scale Drift

Equating error tends to have an insidious and often ignored effect in the interpretation of linked score scales. While the Standards for Educational and Psychological Testing (APA, 1999) indicate that equating error should always be reported, it is rarely estimated and reported in operational testing programs. This is generally true because analytic formulae are typically not available for psychometricians and therefore not implemented in software programs.

Moreover, equating error, when reported, is almost always an underestimate of the true equating variance, as it ignores an important, and equally important, source of variation in the estimated linkage. Cohen, Johnson, and Angeles (2000) demonstrated that equating error is composed of variation in two dimensions: the sampling of students and the sampling of common items. However, the latter source of variance due to the sampling of common items is typically ignored when estimating the variance of an equating function. If a potentially large source of random error is ignored, then the estimate of the equating variance will be smaller than it truly is.

Students are, of course, a sample of students tested in the population, and this source of variation is well-recognized. However, the common items used in a common-item linking design are only a sample from the universe of possible items that could have been used for the common-item design. Had another exchangeable set of common items been used, a small difference in the estimate of the equating function would have been estimated.

Michaelides and Haertel (2004) demonstrated that the variance due to the sampling of common items is at least as large as the variation due to the sampling of students. As a result, any estimates of the equating variance that ignores the sampling of common items would underestimate the true variance of the equating function and potentially claim that scale drift exists when the observed changes are expected given the sampling variance of the linkage.

The implication of this missing source of variance is important with respect to scale drift. Suppose an equating function yields a linkage and its variance is computed but underestimates the true sampling variance. If changes in score distributions occur in future years, one risk is that the change is no larger than what the true variance of the equating variance would imply. However, the change might either be attributed to scale drift or true changes in the population.

This implies there are two important tools necessary to properly study scale drift with respect to equating variance. First, all sources of variation must be considered when estimating the variance of the equating function. AIR has pioneered work in this area (Cohen *et al.*, 2000), and our work has led to changes in how the field of psychometrics views the error in equating functions.

Second, analysis methods must be articulated and accessible to psychometricians to estimate the equating variance. AIR has done extensive work in this area and our iAM item response theory (IRT) software provides estimates of the equating error as a by-product of item calibrations. Outside of the software, AIR has demonstrated with other state operational testing programs how resampling methods, such as the jackknife method, can be used to estimate equating variance.

Potential Effects of Changes in the Trait on Scale Drift

In some cases, shifts in a tested blueprint or changes in the curricular structure (such as better alignment to the Next Generation Sunshine State Standards) may allow for scale drift if a change to the measured trait is substantial. This is particularly important in that performance cuts are set on the scale in the initial years and scale drift could affect the interpretation of the performance cuts if changes in the interpretation of scores changes over time.

If the underlying trait is changing, then one way this could be identified and accommodated is through a confirmatory standard setting procedure. Panelists could reconvene at a future point in time (say the summer of 2018) and revisit the ordered items booklets originally used for standard setting and the performance level descriptors. Panelists would evaluate if the ability estimate corresponding to important cut scores on the test have the same meaning and interpretation with respect to the performance level descriptors as they did previously. If they detect changes in the meaning and interpretation of the scale, possible changes to the cuts might be considered.

A Proposal to Study Scale Drift in Florida

The ITN does not call for a specific study to be proposed at this time, but does call for the details of that study to be presented to the Department and its technical advisory committee (TAC) in the spring of 2018. To support the state in this area, there are two keys areas of work for AIR to consider. To begin, it is important for the new contractor to understand linking and equating methods that are likely to mitigate the effects of scale drift over time (Harris & Kolen, 1994). AIR is cognizant of these recommendations, and our test development protocols used for large-scale testing programs build linking sets and use linking methods that are known to minimize the effects of scale drift.

Additionally, AIR will provide the state with a complete research plan for its review and distribution to the TAC. That review will include a complete and comprehensive review of the literature on scale drift and methods for assessing its impact. Various methods for assessing drift have been proposed (Gou, Liu, Dorans, & Feigenbaum, 2011; von Davier,

2009). A technical report following the implementation of the study will be provided to the state documenting the methods, results, and implications.

Optional Validity Studies to Support Uses of Test Scores in Accountability Systems

The policies surrounding the use of the performance level cuts and the scaled scores are high-stakes in nature. For this reason, some validity evidence should be collected to assess the degree to which the cuts are appropriately aligned to support the state policy objectives. As noted, these are not required in the ITN and therefore AIR is proposing these as optional validity studies that are not included in our base cost.

Evidence to Support Use of Grade 3 Level 2 Cut score

The state accountability system requires students in grade 3 to score at level 2 or above in reading to be promoted to grade 4. Some exemptions to this rule exist, such as students demonstrating performance on an approved alternative standardized test or a student portfolio. However, outside of these exemptions the rule sets a minimally acceptable level of achievement that students must demonstrate to be promoted to grade 4.

Clearly this rule exists to provide students with the support in reading they need before moving on to higher grades. Hence, the underlying hypothesis is that students who do not score at level 2 in reading do not possess the prerequisite skills needed to be successful in grade 4 and beyond.

The policy objective aims to use a cut score to differentiate between students who are likely to succeed in future grades without further remediation and support in reading. Therefore, validity evidence should be available to substantiate two issues:

1. Evidence should be available showing that students who do not score at level 2 or above would in fact continue to struggle in grade 4 and beyond.
2. Students that are retained in grade 3 via this policy benefit from that retention and demonstrate improved levels of achievement in grade 4 and beyond.

Because this rule is enacted in the state, it is not possible to collect evidence from within Florida that provides evidence related to the first issue. Data from within the state can be collected to gather evidence on the second issue.

The state of Utah is considering a similar policy and is interested in partnering with AIR to complete a study on the validity of cut scores used in a fashion similar to the Florida policy. Currently, students in grade 3 in Utah are not retained via the cuts and evidence from that state can be collected relative to the first research question.

If this optional study is desired, AIR can facilitate collaboration in this research task with both states and complete a study to provide the necessary validity evidence. If the state selects this proposed optional study, AIR will provide a complete research plan for its review and submission to the TAC. Final results will be provided in presentations to the state and its TAC and in a technical report documenting the methods and results.

Evidence to Support Use of Graduation Requirements

Another area in which the cuts have a student-level accountability component is with the high school end-of-course tests. The tests to be passed depend on when students entered high school, but the general principle is the same in

that a passing score on various assessments has been established as one component of an overall graduation requirement.

Here the policy objective is to use a cut score to differentiate between students who are prepared for career and college readiness and those who are not. Similar to the previous research questions, this objective requires validity evidence regarding the following:

1. Evidence should be available showing that students who do not achieve a passing score are not as well prepared for career or college as those who do achieve a passing score.
2. Students that do not graduate via this policy subsequently benefit and demonstrate skills commensurate with students who are career and college ready.

AIR and the state of Utah are currently planning a study, to be conducted in the spring of 2014, to evaluate the empirical relevance of the Common Core as measured by the SAGE for college readiness. The study will administer the SAGE to college freshmen in remedial courses and college freshmen in good standing in standard courses. Statistical analysis will evaluate (a) the relationship between SAGE scores and the need for remediation and (b) the SAGE score that best discriminates between students who do and do not require remediation. The current plan will include a full range of community colleges, colleges, and universities in Utah, but the Utah State Office of Education is interested in extending this study to other collaborating states. We would encourage Florida to participate in this study if the SAGE assessment is given as a base test. AIR has had informal talks with Smarter Balanced Assessment Consortium leadership encouraging a similar study with their test.

If this optional validity study is chosen, AIR can facilitate collaboration in this research task with both states and complete a study that provides the necessary validity evidence. AIR will provide a complete research plan for state review and submission to the TAC. Final results will be provided in presentations to the state and its TAC and in a technical report documenting the methods and results.

Evidence to Support Continued Use of Scaled Scores in Growth and Value-Added Models

AIR is currently serving as the state's value-added contractor, and during this time, we have provided the state with studies showing the effects of transitioning from the FCAT 1.0 to the FCAT 2.0 with respect to the value-added model. Again, a new transition study will be necessary when a new vertical scale is introduced. In Section 7.6.3.3, we provide a detailed response showing how the new scale can be linked with the FCAT 2.0 scale. However, a scale must have properties beyond this linkage that make it useful for a high-stakes teacher accountability system.

There are generally two criteria that must be in place for a test scale to be appropriate for a value-added model:

1. The test itself must be highly aligned with the curriculum enacted by classroom teachers.
2. The test scores must be highly related to the prior test scores used as the control variables in the model.

The first criterion is resolved through a test development process that aligns forms with test blueprints matching the Next Generation Sunshine State Standards. The second criterion evaluates the statistical relationship of the scores and the degree to which the underlying trait measured by both scales is related. To assess this relationship, AIR proposes to evaluate the correlation between the two traits measured by the new and old tests using mar-

ginal maximum likelihood (MML). In the MML equation below, we treat the student ability parameter as a nuisance parameter, as it is measured with error, and integrate that out of the likelihood.

$$L(\boldsymbol{\mu}, \boldsymbol{\Sigma}) = \iint p(z_{i,a}|\theta_1)p(z_{i,b}|\theta_2)f(\boldsymbol{\theta}|\boldsymbol{\mu}, \boldsymbol{\Sigma})d\theta_1 d\theta_2$$

where $p(z_{i,a}|\,\theta_1)$ is the probability of a correct response for individual i to the items on test form a and $p(z_{i,b}|\,\theta_2)$ is the same, but for test form b, and $\boldsymbol{\Sigma} = \begin{bmatrix} \sigma_1^2 & \rho\sigma_1\sigma_2 \\ \rho\sigma_1\sigma_2 & \sigma_1^2 \end{bmatrix}$. Obtaining item responses from both test forms would require a small experimental design where a subset of students take the new Florida Standards Assessments and additionally take the old FCAT test in the same school year.

We maximize the function with respect to the mean and variance covariance matrix. For the current analysis, the focal parameter is ρ, which represents the true correlation between the underlying traits measured by the two tests.

If this option is selected, AIR will provide a complete study design for the state and its TAC to review. Results and details of the study will be provided in a complete technical report.

7.6.3.6.1 Investigate the Comparability between Devices Delivering Assessments

The comparability of scores resulting from different modes of administration has been a central question since the introduction of computers in assessment (Huff & Sireci, 2001). Much of this research has concluded that paper-and-pencil and online assessments can be constructed so that resulting scores are comparable (Paek, 1995; Mead & Drasgow 1993). However, mode effects have been found when items require scrolling, such as is typically the case with reading tests (Bergstrom, 1992; Way, Davis, & Fitzpatrick, 2006), in situations where test timing impacted performance (Ito & Sykes, 2004), for mathematics items requiring graphing and geometric manipulations (Keng, McClarty, & Davis, 2006), and for the lower-grade students (Choi & Tinkler, 2002).

Drawing a single conclusion regarding score comparability is difficult because the technology that underlies test administration is rapidly evolving. Score comparability research quickly becomes outdated as test administration engines are refined and deployed on a variety of platforms (e.g., desktop, laptop, tablet) using different operating systems (e.g., iOS, Windows, Linux) using different devices (e.g., iPad, Microsoft Surface, Samsung Galaxy with Android) of varying shapes and sizes. Differences in how test administration engines are deployed can potentially impact the comparability of student scores.

Furthermore, students have much greater experience in working with different devices and platforms using different tools at earlier and earlier ages. The presentation of all aspects of the test administration (e.g., items, tools, input) must be natural for a given device. Changing devices students are accustomed to working with, or changing particular aspects or features of a given device for test administration, can further introduce confounding variance. Therefore, ongoing evaluation of score comparability is recommended when testing programs offer test administration via multiple platforms/devices.

We present two options to address the comparability between devices delivering the assessments. The first option is a randomized trial in which students are assigned a device. While in most cases randomization provides assurance that biasing factors do not affect results, in this case, randomization may introduce biases. For example, students who are accustomed to using a particular device may be distracted by the

challenge of adapting to the new device. The second option, a matched sample of naturally occurring device users, suffers from self-selection into the device category but does not introduce the added distraction of switching devices.

In either case, we are proposing to investigate the comparability of scores administered via three major categories of devices: desktop, laptop, and tablet. Should the Department be interested in specific comparisons of particular operating systems (e.g., iOS versus Windows) or different devices (e.g., iPad versus Android), we can readily modify our plan to reflect this focus. Regardless of the specific platforms and/or devices ultimately used within the comparability research, our research will be designed to address the following questions:

- To what degree are item-level and test level scores obtained from various devices comparable?
- To what degree can score comparability be obtained through scaling items onto a single metric, linking, or concordance?
- What interactions exist among device and item/task characteristics and among grade, subject, and student characteristics?

The evaluation of score comparability for different devices will be documented in a technical report and presented to the Department and the TAC regardless of which option is ultimately selected.

Option 1 (Not Included in Base Cost): An Experimental Design Evaluation of Score Comparability

For the optional score comparability study, we will select one test form for each grade and subject that will be administered over different devices. In order to keep test administration time for students participating in the study to a manageable level, the test will be divided into two parts to form approximately equivalent subtests in terms of content coverage and item types. Both subtests will be administered via different devices and we will counterbalance the order of administration of each subtest and device to control for individual differences and potential item position effects. An illustration of the design is presented in Exhibit 7.6.3.6.1-1 for evaluating score comparability of assessments delivered via iPad versus Android.

Exhibit 7.6.3.6.1-1: Illustration of Comparability Study Design for iPad/Android for Single Grade/Content Area

Group	Device 1	Subtest	Device 2	Subtest
1	iPad	A	Android	B
2	iPad	B	Android	A
3	Android	A	iPad	B
4	Android	B	iPad	A

For schools that agree to participate in the comparability study, we will randomly assign students in classrooms to one of four test administration conditions. Each subtest of items will be presented via the iPad to half of the students participating and via Android to half of the students. Each student will take two subtests, one via iPad and one via an Android tablet.

Sampling Plan

As described in Section 7.3.5, Embedded Field Testing, it is essential to address the clustered nature of the educational assessment data required for the comparability study. Depending on the size of design effect, the impact of the clustering dictates that to obtain an effective sample size of 1,000, a sample of approximately 3,000 students may in fact be required to estimate item parameters and accurately estimate their associated standard error for each group. Thus, to address score comparability for a given grade/subject area for Exhibit 7.6.3.6.1-1 above, 12,000 students would need to be sampled for a given device/platform comparison.

Analyses

Our analysis will be focused on whether the use of a particular device leads to specific advantages or disadvantages for students taking the EOC assessments. Ability estimates will be estimated for each device and summary statistics will be compared for all students as well as relevant subgroups using analysis of variance methods. Comparisons of item parameters and associated scoring conversion tables will also be made after calibrating items within and across conditions. In addition, differential item functioning (DIF) analyses will be used to examine item-level differences across devices. Our experience with such analyses is that test scores are comparable across different devices.

Option 2 (Included in Base Cost): Evaluating Score Comparability using Matched Samples

With classroom testing time at a premium and the associated impact on administration and score reporting schedules, we acknowledge that experimental design work as described in Option 1 is often impossible to implement in K–12 testing programs. As an alternative, we are proposing to address score comparability for the EOC assessments using matched samples that are specifically constructed to form equivalent groups. While a variety of approaches can be used to construct matched samples (Karkee, Kim, & Fatica, 2010; Moses, Deng, & Zhang, 2011; Way, Lin, & Kong, 2008), key demographic variables such as gender, ethnicity, and prior achievement are typically used as matching criteria. Once the matched samples have been developed, they are treated as equivalent groups that can be used to evaluate mode comparability. That is, the matched sample reduces the bias between the groups when randomization is difficult or impossible.

Propensity score matching (D'Agostino, 1998; Rosenbaum, 1995; Rosenbaum and Rubin, 1983; Rubin 2006) will be implemented to construct equivalent groups of students who took the EOC assessments using different devices/platforms. Propensity score matching uses covariates to predict group membership (e.g., device administered) using logistic regression. Each student who took the test on a given platform is matched with a student who the test on another device or platform based on their propensity scores.

Demographic information such as (gender, ethnicity, income level status, ELL status, IEP, and prior performance) will be used in developing the propensity scores for the device comparability analyses. Propensity scores, expressing the likelihood that each student was a member of each group taking different devices, are then used to select the equivalent groups of students.

Analyses

Once equivalent groups are constructed, our analysis will be focused on whether the use of a particular device leads to specific advantages or disadvantages for students taking the EOC assessments. IRT calibrations will be performed to evaluate the differences between the groups of students taking the test using different devices. Ability estimates will be estimated for each device and summary statistics will be compared for all students as well as relevant subgroups. Score comparability over different devices will be compared using analysis of variance methods. Comparisons of item parameters and associated score conversion tables will also be made after calibrating items within and across conditions. In addition, DIF analyses will be used to examine differences across devices at the item level.

7.6.3.6.2 Linking Florida Standards Assessments to Other Assessments Measuring the Same Standards

The Department would like to link the Florida Standards Assessment (FSA) scale to the scales in other tests in states that measure the same content standards. The first step in this linking process is to conduct a comprehensive curriculum-matching study to determine content overlap between Florida content standards and content standards in other states.

Curriculum Matching Study

AIR content experts will obtain the English Language Arts/ Literacy (ELA/L) standards and Mathematic standards for grades 3–12 from other states that have not adopted the Common Core State Standards (CCSS). We will also survey the states that have adopted the CCSS to see if they are using a subset of the standards or have modified the standards. AIR content experts will map the Florida standards to the standards of these other states, indicating which standards for each grade level and content area are the same and which are different. Part of the analysis will investigate which states had a focus for each grade level and content area that is the same or different. For example, number and operations may still be the focus for grade 3 even though the exact wording of the standards may differ. AIR content experts will prepare a comprehensive report that lists all these findings and present it to the Department. AIR content experts will prepare a list of suggested states for linking based on these findings and present them to the Department. We expect this curriculum-matching study will be completed by summer 2015.

Linking Plan

Following the curriculum-matching study, AIR will develop a linking study plan that would be reviewed by the Technical Advisory Committee (TAC) and approved by the Department. AIR will negotiate with target states to share items that can be used for linking. Such a linkage will benefit both states. If the states do not wish to share items, then an anchor test linking design would be used to put FSA scores on the scale of the target state with similar content. A two-stage statistical moderation procedure would be used to link the FSA to the National Assessment of Educational Progress (NAEP) and then link NAEP to the target state. In this case, NAEP is used as the anchor. This procedure would provide linking data for grades 4 and 8 for Reading and Mathematics.

In the case of cooperating states, we propose to select a sample of the state's items that matches the target state's blueprint. During the 2014 administration, we will randomly embed these items in field-test slots. This approach maximizes the information available for the calibration of the target state items onto the FSA scale through concurrent calibration. The items would then be linked back to the target state's scale using a Stocking-Lord procedure. We will estimate the linking error for these linkages, as described in Section 7.6. This will provide the Department with (a) an estimate of the correspondence between the FSA scale and each target state's scale; and (b) an accurate margin of error around that correspondence.

One of the options offered in the AIR proposal is the use of the Smarter Balanced test for the FSA. If we do not use the Smarter Balanced test, we can still use Smarter Balanced items and license it for a sufficient number of students to conduct a common item linking study between the FSA and Smarter Balanced. We will include a draft of the Smarter Balanced policy in Appendix N. To accomplish this, items would be obtained from Smarter Balanced and used in a linking study embedded in the FSA. Smarter Balanced is required to provide this information based on their

cooperative agreements with the U.S. Department of Education.* This would provide the Department with linking data for all subjects and grades that overlap between the FSA and Smarter Balanced.

Statistically linking to the Partnership for Assessment of Readiness for College and Careers (PARCC) would not be possible until after its post-equating in the spring 2015 because PARCC item parameters would not be available until then.

We will deliver an initial linking study technical report for TAC review and deliver the final, revised report by July 2015. The technical report will include concordance tables showing how the FSA is aligned with other state assessments using the same content standards. If PARCC items become available, we will update the technical report when the PARCC item parameters become available.

7.6.3.6.3 Linking Florida Standards Assessments to International Assessments

International Benchmarking

Florida would like to know that their performance standards are not only college and career ready, but that they are also internationally competitive. To accomplish this, AIR would develop a plan for international linking using data from the Trends in International Mathematics and Science Study (TIMSS), the Progress in International Reading Literacy Study (PIRLS), or the Program for International Student Assessment (PISA). The plan would be reviewed by the TAC and approved by the Department.

The international linking plan would include a review of available international data for linking which depends on the testing schedule of the international studies.

a. PISA is on a 3-year cycle with the last administration in 2012, with a release in December 2013, and the next assessment in 2015, with a release in December 2016.
b. TIMSS is on a 4-year cycle with the last administration in 2011, with a release in December 2012, and the next assessment in 2015, with a release in December 2016.
c. PIRLS is on a 5-year cycle with the last administration in 2011, with a release in December 2012, and the next assessment in 2016, with a release in December 2017.

Both the SAGE exam and the Smarter Balanced exam plan to embed PISA items to establish a link to high school math, and this information should be available for SAGE by mid-summer of 2014. This linkage information will be available to the Department.

Linkages to TIMSS or PIRLS cannot be accomplished through common-item embedding because they do not allow their items to be used this way in other assessments. AIR has obtained permission from the Organisation for Economic Co-operation and Development (OECD) to use secure PISA items for purposes of linking. TIMSS and PIRLS do not permit the use their items for this purpose (I. Mullis, personal communication, November 21, 2013).

*For example, the PARCC cooperative agreement states "unless otherwise protected by law or agreement as proprietary information, make any assessment content (i.e., assessments and assessment items) developed with funds from this grant category freely available to States, technology platform providers, and others that request it for purposes of administering assessments, provided they comply with consortium or State requirements for test or item security" (Smarter Balanced cooperative agreement with the U.S. Department of Education, January 27, 2011, pp. 11–12). Similar language is in the PARCC cooperative agreement.

AIR has already conducted linking studies to inform the standard setting process in three states: Delaware, Hawaii, and Oregon (Phillips & Jiang, 2011).

The following is a brief description of how the linking study would be conducted. AIR has obtained 30 representative items for each subject tested in PISA (reading, mathematics, and science). For the Florida Standards Assessments, only the items in reading and mathematics would be used. The 30 items would be embedded as field-test items in the online Florida Standards Assessments. The AIR field-test algorithm would randomly administer the PISA items just like it would any other field-test item. For example, let's say that if the state had F = 400 field-test items, P = 30 PISA items, and the test length was L = 40 items a student takes in the test administration, then the expected number of PISA items administered to each student would be $E(p) = 1/F * L * P = 3$. If the student population size was N = 200,000, then the expected sample size per PISA item would be $E(n) = 1/F * L * N$ = 20,000. The number of items per student does not provide enough information to get estimates of PISA scores (i.e., distributions of PISA-plausible values), but it does provide enough students to get good state-based estimates of the PISA item parameters. This then permits the state test to be linked to the PISA scale through common-item linking.

Below is an example of the type of data that would be obtained from the international linking study between Florida and PISA. The example in Exhibit 7.6.3.6.3-1 is from an international benchmarking study between Hawaii and PISA in mathematics.

The international benchmarking study can be summarized in the above table. The first column shows the page numbers of an ordered-item booklet with 61 pages used during the standard setting in mathematics. The second column shows the item parameters associated with the page numbers in the ordered-item booklet, and the third column contains the thetas associated with the response probability for each item. The fourth column notes the standard error of the theta associated with the response probability. This standard error is needed because it is a component of error in the standard error of the PISA-equivalents. The fifth column includes the state impact data used during the standard setting. This column tells the panelists what percentage of students is likely to reach the performance standard depending on which page number is selected. The sixth column shows the PISA-equivalent of the theta in the third column. The seventh column contains the standard error of the PISA-equivalents. The eighth column shows the inverse cumulative percentage for the population of 30 OECD countries that participated in the 2006 PISA. It shows the approximate percentage of students across the OECD countries that would reach each PISA-equivalent performance standard. The previous proficient performance standard for mathematics in Hawaii was on page 19 of the ordered-item booklet. The standard setting panelists decided to place the new Hawaii proficient performance standard on page 26. This raised the state's proficient performance standard from a standard comparable in difficulty to Level II of PISA to one that is comparable in difficulty to Level III of PISA and similar to the international average of the OECD student performance.

Validity of International Benchmarking

The international linking study plan would also include strategies for verifying the validity of the international linking study. This could be done in several ways. A validity analysis could be conducted by correlating the PISA item parameter estimates obtained in Florida with the estimates of the international item parameters obtained by the OECD. A high correlation

1	-0.45	1.8	0.12	84	563	9	93

would indicate that Florida and the OECD are getting essentially the same estimates.

NAEP and international studies tend to provide the same ranking for states. For example, Massachusetts tends to be ranked the number one state in NAEP, TIMSS, and PISA. A validity check could be obtained by seeing if the PISA linking ranks Florida about the same as NAEP. For example, if the state NAEP for Florida ranks just below the national NAEP, then we would expect the state PISA for Florida to rank just below the national PISA.

4. Management Plan

7.7.0 Program Management

4. Management Plan

7.7.0 Program Management

AIR recognizes the key role that the Florida Standards Assessment (FSA) will play in Florida's educational system, with high stakes for schools, districts, teachers, and students. Florida's commitment to transparency supports these high-stakes uses by enabling stakeholders to see how the tests are created and deployed.

AIR's management approach is designed to support such high-stakes, high-visibility programs. Our management approach relies on an extensive system of planning and specifications documents. It is not enough for all participants in the process to hear the same decisions in a meeting; decisions must be documented in a place where they can be easily found, referenced, reviewed, and considered. For this reason, each aspect of the testing program is governed by a specification or planning document. Each document has a designated location with Knowledge Tree, the secure online service that we use to control management documents and manage the change workflow.

Section 7.7.6 describes the collection of documents that, together, support the management of the program. Each document enlists stakeholders, and as decisions are made or changed, each stakeholder is alerted to review the change, so that the ramifications of the decisions can be considered by the technical experts in all areas. For example, a change to a draft blueprint may have implications for what can be reported, what data is transferred among systems, and possibly even data file formats. Our management communication ensures that these impacts are understood at the time that decisions are made.

Managing this complex project requires a project management team that is experienced at focusing people on the important issues and helping them reach consensus. AIR's senior program manager, Kevin Murphy, will have overall, daily responsibility for all processes and deliverables under the full scope of this program. More specifically, the Program team will be responsible for maintaining the implementation plan and schedule and for ensuring open and frequent communication with the Department staff to provide updates on status, key accomplishments, upcoming activities, and issues. Section 7.7.2 provides details about the highly qualified personnel AIR proposes to work closely with the Department to manage the contract.

AIR understands that adhering to standard processes and documentation is critical to the program's successful operation, and we use a set of unique management tools and reports to ensure the program is on target, the schedule is maintained, and the deliverables are successfully addressed and completed. In Section 7.7.6, we describe our management approach and management tools for planning, monitoring, and managing changes to the Department's assessment program and our quality assurance protocols. We describe how we will use our management experience and tools to successfully complete the work under this contract while collaborating with the Department. We have successfully applied these methods on state programs and will adapt to meet the Department's requirements.

We are proud of our work, and we look forward to a productive relationship with the Department that serves Florida students and advances the assessment field.

7.7.1 Provisions Governing the Work of the Contractor

AIR acknowledges and commits to the provisions governing the general work of this contract.

a. AIR's project team will work with the Department to secure approval of all processes and products at milestone stages. Applying the management methods described in Section 7.7.0 and the procedures detailed throughout this proposal will ensure that communication, transparency, and decision-making are clear and documented co-efforts between AIR and the Department. We will make significant efforts to define the specifications of tasks and products with the Department. AIR's project schedules will ensure specifications are defined in a timely manner for successful implementation.

b. The Department will have design control as it relates to the assessment logo and color scheme of AIR systems and AIR-produced documents. Our systems are designed to be branded for our clients, and we will work with the Department to identify its preferred logo and color scheme. Some of our secure testing apps will have to retain AIR branding because the distribution outlets (i.e., Apple App Store) will not let us post multiple versions of an app with different branding.

c. AIR and the Department will collaborate on the creation and maintenance of materials used to support and administer the Florida Standards Assessment (FSA). Reasonable modifications to these materials will be captured within the scheduled review and edit phases of the product's schedule. AIR will endeavor to implement those modifications prior to printing, production, or deployment. Modifications requested outside of the review and edit phases may impact the delivery of subsequent deliverables.

d. AIR has accounted for annual modifications to products and processes within the scope of this proposal. As mentioned in Section 7.7.5, annual planning meetings will allow us to capture new or updated information for each administration or contract year. Modifications will also be captured in more detail in the annual revisions of specifications and materials, which will be reviewed and approved by the Department. We will secure approval of print quantities from the Department prior to production to reduce costs and security risks.

7.7.2 Contractor Staff and Responsibilities

In this section, we introduce the staff from both AIR and DRC.

AIR's Assessment Program includes 380 full-time and 200 temporary staff members available to support Florida and other state assessment clients.

AIR's assessment work operates under the direction of Dr. Jon Cohen, AIR's Executive Vice President and President, Assessment; Steve Kromer, AIR's Vice President for Assessment; and Heather Hayes, who directs all online testing projects at AIR. Dr. Cohen, Mr. Kromer, and Ms. Hayes have the authority to make corporate decisions related to this project. Dr. Cohen and Ms. Hayes, and other AIR senior managers, are intimately involved in project operations and attend key planning, progress, and even technical meetings.

AIR's Assessment Program Structure

The organizational structure of each of AIR's projects follows the functional organization of AIR's Assessment Program. We summarize the

organizational structure and the depth of capability of our staff below. AIR's corporate directors work directly on our state projects more than 90% of the time. AIR's Assessment Program is organized functionally, and each functional area is led by a member of AIR Assessment's senior management team. Within each functional area and for each project, teams are formed and a team leader is designated. The team leader takes first-line responsibility for the team's products and services for the project, with ultimate responsibility resting with the corporate director of the relevant functional area.

Dr. Cohen sets the vision and standards for the program; recruits, develops, and motivates staff; and makes sure needed infrastructure and procedures are in place. AIR's approach to managing personnel and staff ensures that there is a team to support each contract requirement and that required information never resides in a single person.

Steve Kromer brings more than 25 years of assessment experience to his role as AIR Assessment's Vice President. In this role, he is responsible for ensuring that repeatable processes are in place in each functional group and that we follow these processes in delivering each program.

Given the specialized nature of our work and AIR's unique approach to it, staff are expected to master their capabilities through an apprenticeship system predicated on the gradual increase of individual responsibility. Group training sessions and collaborative interaction that encourage and promote mentoring and supervision are at the core of this system. We achieve this goal by organizing work into structured teams, each with well-defined specifications and work processes:

- Project Management
- Computer and Statistical Sciences Center (CSSC)
- Psychometrics and Statistics
- Test Development
- Operations and Scoring
- Online Testing Systems
- Communications and Reporting

Project Management

Director:
Heather Hayes, J.D.

Senior Program Manager:
Kevin Murphy, M.A., P.M.P.

Team Leadership

State assessment contracts such as the Florida Standards Assessments are large and complex, involving many different skills, client management staff, school staff, vendors, systems, datasets, schedules, and other resources and stakeholders to operate efficiently. The Project Management team is responsible for orchestrating these resources to deliver and report on multiple assessments.

Ms. Hayes serves as AIR corporate director for project management for online testing programs and leads a team of 38 project management and operations staff members, 26 of whom hold master's or Ph.D. degrees. Ms. Hayes has more than 15 years of experience in online systems, including managing Oregon's online testing project and documenting and transferring best practices in online, multiple-administration testing from Oregon to newer AIR state clients including Delaware, Hawaii, Minnesota, and Ohio and soon Utah, Missouri, and Michigan. She received her J.D. from the University of Iowa.

For this project, AIR is proposing one of our most experienced senior program managers, Kevin Murphy.

A Project Management Institute (PMI) certified manager, Mr. Murphy has more than 12 years of experience directing multi-million dollar, statewide assessment projects. For 8 years at AIR, he has successfully led the paper/pencil testing program in Ohio, managed projects to transition Hawaii and Delaware from paper/pencil testing programs to 100% online, and managed Minnesota's dual-mode program. He is experienced in all aspects of assessment projects, including test development, paper/pencil and computer administration, psychometrics, scoring, reporting, and professional development. Mr. Murphy also brings 6 years of classroom teaching experience. Mr. Murphy received his B.A. in Business from Lehigh University and his M.A. in Secondary Education from Hunter College.

Ms. Hayes and Mr. Murphy will be completely familiar with the entire project and will participate in all meetings. Together they will lead all internal management meetings with AIR and DRC staff and all communications with Florida management staff and serve as a team for communication with other stakeholders. Mr. Murphy will take the lead on schedules, produce minutes and other documentation, and implement the project management and quality assurance procedures to ensure fidelity to the project's goals and policies.

Computer and Statistical Sciences Center (CSSC)/Online Testing

Director:
Selina Tolosa, M.B.A.

Project Manager, Computer-Based Testing:
Stacy Tsakeris, M.B.A.

Team Leadership

CSSC is responsible for both our software infrastructure and our software products, including the technology and support for AIR's student registration, online testing, reporting, learning management, and related systems.

CSSC takes as its mission the development of innovative products and systems that will keep AIR's Assessment Program at the forefront of our field. CSSC combines a structured software development unit (developers and project directors) with a team of statisticians, psychometricians, and mathematicians. It is organized into groups supporting families of software systems:

- Preproduction systems: Responsible for systems that support assessments before they are delivered, including test development, publication, and user management
- Test delivery and reporting: Responsible for our high-demand, public-facing systems that deliver tests and reports, as well as other curricular and educational supports
- Data analysis: Responsible for test data processing, analysis systems, and data deliveries

Each family of systems has a technical lead, and together these technical leads form a committee responsible for overseeing peer review of key documents such as requirements, design documents, and test plans, as well as peer review of program code.

CSSC's interdisciplinary team includes more than 120 staff members, nine of whom have

Ph.D.s in areas ranging from computer science to statistics and engineering. Fifty-three of their software project directors and other engineers have M.B.A.s and other advanced degrees.

Close interdisciplinary collaboration enables CSSC to develop remarkable technical products that effectively turn raw data into useful information and manage complex human processes to efficiently support test development, psychometrics, and score reporting.

For eight years, Selina Tolosa has served as team leader for the development and implementation of assessment software systems at AIR including AIR's online test delivery engine for operational tests (Oregon, Delaware, Hawaii, and Minnesota). Prior to joining AIR, Ms. Tolosa was the director of information services and the financial officer for New American Schools, a nonprofit organization funding the development of schoolwide designs aimed at transforming elementary and secondary schools. Ms. Tolosa also brings experience in financial forecasting and analysis; quality assurance of government enterprise systems; and the application of database skills, statistical sampling, and relational databases to data organization of assessment systems. Ms. Tolosa received her M.B.A. from the Wharton School of Business, University of Pennsylvania.

Reporting directly to Ms. Tolosa, Stacy Tsakeris will serve as project manager, computer-based testing. Ms. Tsakeris is managing the quality control for the Smarter Balance field testing in 24 states and also managing the test content documentation of the Open Source software which will be available to the Smarter Balanced states. Ms. Tsakeris has more than 10 years of experience in software project management and has earned her PMP, her M.B.A, and her B.S. in Computer Science and Engineering. She will be supported by our most experienced team of software project managers and engineers

Psychometrics and Statistics

Team Leadership

Vice President and Chief Psychometrician:
Gary Phillips, Ph.D.

Psychometrics Lead:
Harold Doran, Ph.D.

AIR's Assessment Program offers psychometric and statistical services that stand alone in terms of quality and innovation. The integration of psychometrics with statistics and sampling sets AIR apart from the competition.

Although testing firms often bring expertise in psychometrics, the quality of those services depends dramatically on the samples on which the data are based. Typical samples used in state testing programs can undercut the best psychometrics, leading to volatile test results from year to year and inaccurate classification of examinees. AIR combines expertise in sampling and psychometrics; all of our samples are optimized, and our statistics accurately reflect the complexities of the sample designs.

Dr. Gary Phillips leads the Psychometrics and Statistics team, which includes 14 lead psychometricians with Ph.D. degrees and more than a dozen statistical programmers, research associates, and other supporting staff.

Dr. Phillips brings 26 years of experience, with distinctions such as having run the National Assessment of Educational Progress (NAEP) for the federal government and having served as acting commissioner of the National Center for Education Statistics (NCES). Prior to that, he served as the deputy commissioner of NCES. Previous responsibilities at NCES included overseeing the NAEP, the National Adult Literacy Study (NALS), and the Third International Mathematics and Science Study (TIMSS). Dr. Phillips was the architect and served as the executive director of President Clinton's Voluntary National Test (VNT). He

holds a Ph.D. from the University of Kentucky with an emphasis in statistics and psychometrics. He has published or presented more than 200 papers, taught dozens of advanced graduate-level statistics courses, and presented hundreds of workshops on advanced statistical and psychometric topics. His areas of interest are structural equation models, hierarchical linear models, item response theory (IRT) models, and Bayesian inference. He is nationally and internationally known for his expertise in large-scale assessments and complex surveys.

AIR is proposing Dr. Harold Doran as the lead psychometrician. Working closely with Dr. Gary Phillips, Dr. Doran will apply all of the Department-approved technical procedures, will have final approval over all analyses before submission to the Department, and also will lead or oversee the required studies. In addition to supporting the psychometrics of large-scale assessment programs in multiple states, Dr. Doran is an expert in value-added models, growth models, psychometrics, and state assessment policy.

The Psychometrics and Statistics team is responsible for the following tasks:

- Sample design
- Field-test design
- Item analysis
- Analysis of differential item functioning
- Calibration, using both classical and IRT methods
- Parallel form equating and vertical linking of related tests
- Design and implementation of standard-setting sessions
- Design and implementation of special studies, including validity studies
- Randomized field trials
- Cross-form reliability studies
- Program and initiative evaluations

Test Development

Director:
June Zack, M.A.

Project Manager, Test Development:
Sandra Durden, M.A.

Team Leadership

Developing more than 10,000 items annually, our test development staff has been developing and aligning existing items to Common Core State Standards since their inception. This team is led by June Zack. Ms. Zack has been the director of test development for the Assessment Program at AIR for the past 12 years, growing the team to include more than 110 staff members (10 Ph.D. degrees, 61 master's degrees).

Ms. Zack is primarily responsible for the development of items and the assembly of test forms for all of AIR's assessment projects. She is responsible for budget tracking, staffing, product development, and overall coordination of the development of the assessments. Before joining AIR, Ms. Zack worked at ETS for 10 years, managing test development for numerous projects, including the GRE, GMAT, LSAT, SAT, NAEP, and Praxis assessments. Ms. Zack was also involved in project management for the reading, writing, and mathematics development for the ISEE and the CTP IV. Ms. Zack holds an M.A. in Educational Psychology from New York University.

Our Test Development team is responsible for critical activities including the development of assessment frameworks, item and form development, and curricular content development. Across projects, AIR Test Development staff are responsible for the following tasks:

- Framework development
- Test blueprint and item specification development
- Item development and review
- Development and review of scoring rubrics
- Form construction
- Curricular content development
- Development of supporting materials for item release
- Client committee support and liaison with rangefinding services

AIR is proposing multiple senior staff to lead form building, item development, and related activities with the Department. Sandra Durden will serve as the Project Manager, Test Development, and as AIR's Item Development Manager. Ms. Durden has more than 20 years of experience in the field of education, including 10 years in the assessment industry and 10 years as a K–8 educator. At AIR, she is working on performance tasks for the Smarter Balanced Assessment Consortium and item development for state programs and K–2 formative assessments. Ms. Durden holds an M.A. in Mathematics Education and a B.A. in Elementary Education. Ms. Durden will be supported by Diana Reed and Jim McCann, our content leads for ELA and Math, respectively.

Operations and Scoring

Director:
Dee Wagner, M.B.A.

Project Manager, Test Administration:
Meredith Durgin, B.S.

Team Leadership

AIR's Operations and Scoring team includes 29 full-time and more than 200 part-time professionals and is responsible for print test forms, production, and help desk operations and for warehousing, distributing, collecting, security processing, scanning, editing, performance scoring, and preparing data files. The supporting software systems interface directly with operations relating to pre-ID and ordering, student tracking, print tracking, and other AIR systems.

Dee Wagner, M.B.A., is AIR's Corporate Director for Operations. Ms. Wagner has more than 22 years of experience managing large, high-stakes assessment projects, including the past 13 years at AIR. Ms. Wagner has overseen test administration, security, and assessment operations, which include activities related to producing, delivering, receiving, scanning, and scoring test materials. She is also adept at managing AIR's subcontractors for processing and has managed DRC on paper/pencil testing projects in Ohio and Minnesota. A Six Sigma Black Belt and ISO Certified Lead Assessor, Ms. Wagner gets the most out of staff and consistently identifies and gives more responsibility to high performers. The results have been outstanding; AIR projects run on schedule, within budget, and to high client satisfaction. Ms. Wagner received her operations management (B.S.B.A.) degree from the University of Delaware and her M.B.A. from Philadelphia University.

AIR is proposing multiple project managers and our major subcontractor on this team. Meredith Durgin will serve as project manager, test administration. Ms. Durgin has 10 years of management experience in educational assessment, including managing multi-million dollar projects. Ms. Durgin has served as a senior manager for Oregon's very successful online testing project and has led smaller programs in Florida, Ohio, New Jersey, New Mexico, Texas, Missouri, Arkansas, Montana, and Utah. Cynthia Benis is AIR's help desk manager and manages AIR's help desk across all assessment projects, with a focus on support for online testing. Ms. Benis has 25 years of customer

service experience, including the last 5 years at AIR leading our help desk across projects.

DRC will be responsible for paper/pencil processing and all hand-scoring services for the Florida Standards Assessments. This is a proven relationship; together AIR and DRC have delivered high stakes tests in Ohio and Minnesota without incident for 5m+ tests. We already have established the data flows and automated quality assurance checks between our systems to ensure quality performance.

Communications and Reporting

Director:
Bani Dheer, J.D.

Project Manager, Scoring and Reporting:
Cathy Kugler, B.A.

Team Leadership

AIR goes beyond simply reporting scores and other numbers to provide deep analyses of the data, reported in a clear, appealing, and actionable way. AIR is perhaps alone in the industry in delivering information, often in full color, with variable text and graphics. The reports begin with the same basic data that have been traditionally reported, but they extend much further. The basic data are reported, using tested data displays that facilitate correct interpretation and impede misinterpretation. The implications (as well as limitations) of additional analyses, including the increasingly popular "value-added" analyses, are presented both graphically and in text that is customized for each individual report. Our professional development services focus on assessment administration and data use, helping our clients develop assessment literacy in their states.

Bani Dheer is the director of our Communications and Reporting area, bringing 14 years of experience to this role. Ms. Dheer has led the development and on-time delivery of more than 30 million pages of score reports for AIR clients in Hawaii, New Mexico, Delaware, Minnesota, Ohio, South Carolina, and various city assessment systems. Prior to joining AIR, Ms. Dheer designed and developed the messaging strategies for several national and state education groups, including the National Education Association, the Learning First Alliance, the Civil Society Institute, and the California Teachers Association. She also worked with lead Democratic strategist Mark Mellman to develop the communications strategy for a presidential campaign. Before entering the field of educational assessment and communications, Ms. Dheer worked for five years as managing editor for a Vancouver-based publishing group.

AIR is proposing Cathy Kugler to serve as the project manager, scoring and reporting. Ms. Kugler, who has seven years of assessment experience at AIR, brings a unique combination of statistical and management expertise. She has directly relevant experience managing data files, team schedules, and deliverables for both psychometric and reporting activities for state assessments in Ohio and Minnesota.

Marta Gebrehiwot will lead score reporting for the Florida Standards Assessments. Ms. Gebrehiwot brings experience as the reporting line manager for assessments in Delaware, New Mexico, South Carolina, Minnesota, and other states.

Following the guidelines in the ITN, we have organized the remainder of this section as follows:

- Exhibit 7.7.2-1, on the next page, presents the project organization chart.
- Exhibits 7.7.2-2 and 7.7.2-3, following the project organziation chart, presents the required staffing charts as outlined in the ITN.

- Below we introduce the senior staff members for each functional team. One-page resumes can be found in Appendix A.

AIR's Proposed Project Staff

Project Management

Kevin Murphy, M.A., P.M.P., Senior Program Manager. For this project, AIR is proposing one of our most experienced senior program manager, Kevin Murphy. A Project Management Institute (PMI) certified manager, Mr. Murphy has more than 12 years of experience directing multi-million dollar, statewide assessment projects. For 8 years at AIR, he has successfully led the paper/pencil testing program for 800,000 students in Ohio, managed the projects to transition Hawaii and Delaware from paper/pencil testing programs to 100% online, and managed Minnesota's dual-mode program. Prior to joining AIR, Mr. Murphy worked for 4 years on the North Carolina Testing Program, both at the North Carolina Department of Public Instruction and at North Carolina State University. He is experienced in all aspects of assessment projects, including test development, paper/pencil and computer administration, psychometrics, scoring, reporting, and professional development. Mr. Murphy also brings 6 years of classroom teaching experience (New York State Teacher Certification, Social Studies, grades 7–12) and has experience with reporting systems from his work with the Grow Network. Mr. Murphy received his B.A. in Business from Lehigh University and his M.A. in Secondary Education from Hunter College.

He will be dedicated to work full-time (100%) on the Florida Standards Assessments. As Senior Program Manager, Mr. Murphy will have full responsibility for the development, implementation, and support of the Florida Standards Assessments, including training and other human systems required for the system to work effectively. The senior program manager will be responsible for managing the day-to-day operations and for providing the Department with the information required to effectively monitor progress.

Mr. Murphy will converse directly and frequently with Department staff to ensure that they are kept informed about project progress. AIR's management approach to project communication is predicated on close communication with the Department. We fully recognize the importance of establishing and maintaining frequent communication with the Department to ensure prompt and effective responsiveness to the Department's needs. Mr. Murphy will serve as the primary point of contact with the Department and will be available at all times for telephone consultation and face-to-face meetings over the course of the project. Mr. Murphy will maintain an updated project plan and schedule and will provide regular and frequent status updates to the Department. He has used Microsoft Project and similar predecessor tools in coordinating current and previous projects. The detailed schedule that he creates will include both internal AIR timelines and project milestones that involve the Department. This schedule will be shared with the Department, and any changes will be discussed in biweekly conference calls. Mr. Murphy will work with the Department to design summary reports or calendars that will conveniently portray delivery dates, review timelines, and other scheduled events impacting workflow at the Department.

He will take primary responsibility for liaison with the Department and Florida educators; communication with the Department; working with the Department to define requirements and finalize schedules, planning documents, and specification documents; coordination of test delivery, statistical and psychometric services, test development, operations, and score reporting activities; operational logistics asso-

ciated with rollout of the system; overseeing the printing, packaging, shipping, receipt, processing, and scoring of the paper-and-pencil operations; development of appropriate manuals and documentation; and planning and oversight of logistics and materials for training events.

Florida Policy Advisor and Director, Interstate Relations. AIR has included resources for a half-time senior staff member to serve as a project advisor on policy and to coordinate communications within Florida. AIR will work closely with the Department to identify this person.

Tamonica Jackson, Administrative Assistant, Meetings. Ms. Jackson has more than 17 years of experience in planning and managing conferences, including more than five years of experience in statewide assessment projects in Hawaii, Delaware, and Minnesota. On these projects she is responsible for working directly with the clients, managing conference budgets, hotel search and selection, contract negotiations, vendor negotiations, and travel arrangements and reimbursements. Ms. Jackson plans and manages more than 50 meetings per year for participants ranging in number from 10 to 500. These include TAC, test steering, test content (item and passage), fairness and sensitivity, rangefinding, rubric validation, data review, standard setting, contract management, and various advisory committee meetings. Ms. Jackson has convened assessment-related meetings in AIR offices, hotels, and conference facilities. She assists with registration services, including name badges, tent cards, signs, and participant lists, and ensures the accuracy of custom and/or individualized packets. Ms. Jackson maintains and updates systems for participant travel receipts, itineraries, and reimbursements. She negotiates with hotels and service vendors, coordinating facility and audiovisual equipment arrangements. Her other responsibilities include preparing and collating materials for the distribution of promotional, registration, and other mailings. Ms. Jackson has completed coursework in Business Management from Morgan State University.

Matthew Hirsch, Administrative Assistant. Mr. Hirsch, who has completed three years of classes in computer science at the University of Maryland, has supported assessment projects for more than five years at AIR. He has supported multiple assessments in Ohio, including the high-stakes graduation test. He supports the senior program manager in all project management activities, including meeting agenda, minutes, and associated documentation. He supports integrated scheduling across all AIR teams and subcontractors, and ensures that materials move to and from the client using established protocols. He has become expert in AIR's student registration system from the project management perspective, working with the senior program manager in reviewing specifications, responding to any district or school upload issues escalated to the senior program manager, and monitoring orders for paper testing materials to ensure they are within expected quantities.

Test Development

Sandra Durden, M.A., Project Manager, Test Development. Ms. Durden has more than 20 years of experience in the field of education, including 10 years in the assessment industry and 10 years as a K–8 educator. At AIR, she is working on performance tasks for the Smarter Balanced Assessment Consortium and item development for state programs and K–2 formative assessments. Prior to joining AIR, Ms. Durden worked at Pearson and Harcourt, where she served most recently as director of research and development and was responsible for all phases of new product research, design, and development for learning assessments. In her previous roles as senior assessment design

manager, senior assessment specialist, and content lead, she helped develop research plans, content frameworks, test blueprints, test and scoring designs, and asset development plans. In addition, she managed content development and construction of operational and field-test forms for various statewide assessment programs and national educational assessment products. Ms. Durden taught kindergarten and grades 3, 4, and 5. She also worked as a middle school mathematics teacher for grades 6, 7, and 8. Ms. Durden holds an M.A. in Mathematics Education from the University of the Incarnate Word, a B.A. in Elementary Education from Saginaw Valley State University, and a B.A. in Government/Prelaw from Evangel University.

ELA

Diana Reed, Ed.M., ELA Content Lead. Ms. Reed combines 10 years of experience in teaching and in developing large-scale assessments. At AIR, Ms. Reed currently serves as internal ELA content lead for AIR's project supporting the Smarter Balanced Assessment Consortium, overseeing AIR's development of over 1,500 items. Previously at AIR, she was a grade level lead for the Minnesota State Assessment System. In that role, she supervised forms development for the middle and high school grades, working with both psychometrics and client content leads to create forms. Prior to her work at AIR, Ms. Reed taught English language arts in the Boston Public Schools for 6 years. She mentored teaching interns from Harvard's Graduate School of Education and from the Boston Teacher Residency. Previous teaching experience came from 4 years as a founding teacher at the Girls' Middle School, where she served as technology director, computer science teacher, and language arts teacher. Before teaching, Ms. Reed worked as a software engineer at Intermetrics, Inc., where she developed software that allowed students to create online storybooks and interactive programs. She holds a B.A. from Brown University, where she double-concentrated in English and American Literature and Computer Science. She received her Ed.M. in Teaching and Curriculum from Harvard University.

Leads, Grades 3–5: Christine Keller, Terry Hill, and Allison Stingley

Christine Keller, M.A.T. Ms. Keller joined AIR with 9 years of educational experience as a K–6 and ESOL instructor. In addition to teaching elementary school for 7 years in Pennsylvania, North Carolina, Florida, and the District of Columbia in a range of socioeconomic schools, she is also certified in English as a Second Language (ESL) and Reading for grades K–8. Ms. Keller worked as an ESL-inclusive classroom teacher for 5 years before teaching abroad at the International School of Krakow in Poland and the Changwon City Public School system of South Korea. Upon returning to the United States, she worked as a collaborative learning ESL instructor with the District of Columbia Public Schools. At AIR, Ms. Keller has led ELA diagnostic development for Common Core State Standards-aligned assessments in Ohio and also developed new items for Oregon's English Language Proficiency Assessment (ELPA) and Utah's Student Assessment of Growth and Excellence (SAGE) ELA assessments aligned to the Utah Core Standards. She both develops and reviews new items ensuring the accuracy of item content, scoring, keying, fairness, language, and accessibility. She has led item writer training, constructed forms to blueprints, and facilitated meetings for content, fairness, bias and sensitivity, rangefinding, and data review. At AIR, she also directs the development of K–2 English/language arts diagnostic assessment items and forms. She received her M.A. in Elementary Education and her B.A. in Liberal Arts.

Terry Hill, B.A. Mr. Hill has over 10 years of experience in ELA assessment, with the last 5 years concentrating in passage and item development. He has a B.A. in Professional English. He is currently the content lead for the Minnesota project and the content lead for grades 3–7 in the Utah SAGE project. He has also worked on the Smarter Balanced project and assessments for physical education and visual and performing arts. Prior to joining AIR, Mr. Hill worked at Measurement Incorporated, first as a team leader for the handscoring team, then as an editorial assistant, and finally as an ELA content specialist. There he worked on projects for the states of Ohio, New Jersey, and Texas and helped develop an internal item bank. He received his B.A. in Professional English.

Allison Stingley, M.A.E. Ms. Stingley is currently a test development specialist at AIR and serves as the ELA content lead for the contract with the Hawaii Department of Education for both the Hawaii State Assessments and the End-of-Course Assessments. Ms. Stingley serves as the assistant item development manager for the Hawaii assessments. She is also the writing content lead for the Utah SAGE assessments. Ms. Stingley directs the development of K–12 English/language arts passages, items, and writing prompts and trains junior staff members and outside vendors. She has been responsible for the development and review of approximately 500 innovative items and passages (technology-enhanced items and machine-scored essays) and for facilitating approximately 20 committee meetings (such as content review, bias and fairness review, rubric validation, and data review) with clients, community members, and teachers. Ms. Stingley has experience building both online and paper/pencil forms for Minnesota and Hawaii. She has experience writing items and creating blueprints for Minnesota and Hawaii state standards and Common Core State Standards. Prior to AIR, Ms. Stingley worked as a product developer for Pearson in their curriculum and textbook division and taught grades 11 and 12. Ms. Stingley holds an M.A.E. in Literature from DePaul University and a B.A. in Secondary Education and English from the University of Illinois at Chicago.

Leads, Grades 6–8: Allen Chong, Meghan Mulhern, and Austin Buckley

Allen Chong, M.Ed. Mr. Chong is currently a test development associate at AIR, primarily working for the Smarter Balanced Assessment Consortium project. Prior to his position at AIR, Mr. Chong served as a test development specialist at the Center for Applied Linguistics, in the area of second language acquisition. Mr. Chong also has two years as a teacher in a full inclusion, dual immersion (Spanish-English) classroom in the District of Columbia Public Schools system. Mr. Chong received his M.Ed. from the George Washington University and a B.A. in Political Science from Vassar College.

Meghan Mulhern, Ed.M. Ms. Mulhern has more than 5 years of experience in the field of education, including 2 years of classroom-based experience and over 3 years in teacher preparation. As an ELA test developer with AIR, Ms. Mulhern serves as the listening development lead for the Smarter Balanced Assessment Consortium. In this role, Ms. Mulhern has helped manage the development of over 330 listening stimuli and over 1,000 associated listening items to assess students' ability to analyze point of view, purpose, and quality of spoken texts and to draw and support conclusions based on the content of spoken presentations. Ms. Mulhern has also written and reviewed items for projects in Delaware and Hawaii and assisted in the development of state-approved ELA item specifications for the Common Core State Standards-aligned assessment for Utah. She also serves as a content team liaison with AIR's item tool developers and has provided training for both

internal and external item writers on AIR's technology-enhanced item types. Ms. Mulhern holds an Ed.M. in Language and Literacy and a B.A. in Linguistics.

Austin Buckley, B.A. Ms. Buckley is a test developer at AIR and serves as the ELA content lead for the Delaware Department of Education contract where she leads the development of items and passages across grades 2–12. Additionally, she also serves as grade level lead for grades 4 and 5 for Smarter Balanced listening development, serves as grade level lead for grades 3 and 4 of internal Common Core State Standards development, and contributes to Hawaii End-of-Course development for expository writing. Ms. Buckley creates innovative items for clients and proposals and leads committee meetings with clients and teacher panels. Ms. Buckley holds a B.A. in English Language and Literature from the University of Maryland.

Leads, High School: Mark Lovely, Sean Redmond, and Charles Ferry

Mark Lovely, M.F.A. Mr. Lovely has over 8 years of experience in secondary level assessment. At AIR, Mr. Lovely is currently the performance task lead for the Smarter Balanced Assessment Consortium, overseeing the development of items and stimuli in accordance with the Common Core State Standards. Since joining the staff of AIR in 2011, Mr. Lovely has developed a variety of test materials for Ohio, Delaware, Minnesota, and Hawaii and has served as the lead developer for the Ohio Achievement Assessments, grades 6–8. Previously, Mr. Lovely worked at Measured Progress in the departments of Scoring and Curriculum and Assessment. Before entering the assessment field, Mr. Lovely taught for 7 years at several New England-area colleges, specializing in developmental reading and writing and beginning to intermediate composition. He received his M.F.A. in Fiction Writing from the University of Iowa and his B.A. in English.

Sean Redmond, M.A. Mr. Redmond has 9 years of ELA test development experience at AIR, WestEd, and Riverside Publishing and is currently ELA content lead for Minnesota's assessment programs. His expertise includes writing and reviewing online (including technology-enhanced) and paper-and-pencil test items and passages for 12 states throughout the country, resolving client feedback issues, and building forms. He has also run CAC, bias and sensitivity, and standards setting meetings for various states. Immediately prior to joining AIR, Mr. Redmond developed the verbal portion of the Cognitive Abilities Test 7 (CogAT 7) for Riverside, working on the National Item Tryout through Standardization and the current operational forms. Mr. Redmond designed, orchestrated, and summarized the CogAT Fairness Review of NIT items, working with a diverse group of educators from several countries. He has classroom teaching experience from elementary to college levels. He received his M.A. in English Literature and his B.A. in English and Secondary Education from the University of Michigan.

Charles Ferry, M.A.T. Mr. Ferry brings extensive experience in education and educational assessment to Florida. At AIR, Mr. Ferry develops, edits, and reviews content for various English language arts projects. As a member of AIR's Common Core State Standards team, he is fluent in the standards and was integral in the development of the passage and item specifications that are used to guide the development of the assessment aligned to Utah's Core Standards SAGE ELA assessment. He also serves as the eighth and ninth grade level lead for SAGE. He has been involved in developing and editing a wide range of middle and high school level content for the Smarter Balanced Assessment Consortium, as well as numerous other state projects. He has led content and

fairness committee meetings and has attended rubric validation meetings. Prior to joining AIR, Mr. Ferry served as an English language arts teacher in the District of Columbia Public Schools, where he developed and implemented lesson plans and curricula aligned to the Common Core State Standards. Mr. Ferry received his M.A.T. in Secondary Education and his B.A. in English Literature.

Math

Jim McCann, M.S., Mathematics Content Lead. Mr. McCann has over 8 years of experience in education, including more than 5 years in test development at AIR. During his time with AIR, he has served as a test developer and grade level lead for Ohio, Hawaii, and Delaware, as well as content lead and item development manager for the alternate assessments of South Carolina, New Mexico, and Delaware. As item development manager for the Delaware alternate assessment, he supervised the transition of the alternate assessment from a portfolio-based system to a performance task assessment. This required managing the development of test specification, blueprints, and a bank of field-test tasks for all content areas. Prior to joining AIR, he was a fifth grade teacher in Stafford County, Virginia. Mr. McCann received his M.S. in Educational Psychology with a concentration in Assessment, Testing, and Evaluation from George Mason University and his B.S. in Elementary Education with a concentration in Mathematics from the University of Maine.

Leads, Grades 3–5: Eileen Heneghan and Maureen Font

Eileen Heneghan, B.S. Ms. Heneghan has 7 years of mathematics education experience. At AIR, she serves as a test developer and is responsible for writing, reviewing, and editing math items for various AIR projects. For the Smarter Balanced Assessment Consortium performance tasks, she is the lead developer of 18 classroom activities, which provide the necessary scaffolding for completing the tasks. Prior to joining AIR, Ms. Heneghan worked at Pearson Education, working on the creation, release, and maintenance of the MathXL and MyMathLab products, a series of online courses which provide students and instructors with machine-scored constructed-response problems that correlate to textbook problems. She also has experience working as a teaching assistant for a variety of university courses, including intermediate algebra, linear algebra, and discrete mathematics. Ms. Heneghan is currently pursuing a M.S. in Pure Mathematics at DePaul University (expected May 2014).

Maureen Font, M.Ed. Ms. Font began working for AIR in 2011 after graduating in 2007 from the University of Illinois with an Elementary Education degree (along with a concentration in Mathematics and a minor in Italian). She is currently AIR's mathematics content lead for the Smarter Balanced Assessment Consortium, working on grades 3–11, for the upcoming field test. She was responsible for delivering about 1,000 performance task items for the consortium and managing the internal development process, as well as coordinating many development tasks with other vendors and the client. As a mathematics content lead for Minnesota, working on grades 5–11, Maureen has been responsible for delivering about 500 items each year. Maureen was a middle school math educator for grades 6–8 in Illinois for 4 years before becoming a freelance SPSS data analyst and a program evaluation intern at ChildServ in Chicago.

Leads, Grades 6–8: George Ligon, Kari Thicksten, and Natalie Morgan

George Ligon, M.Ed. Mr. Ligon brings over 8 years of educational experience to AIR, where he is responsible for writing, reviewing and editing math items for various AIR proj-

ects that include state assessments for Hawaii, Ohio, Minnesota, Delaware, and Smarter Balanced Assessment Consortium. Prior to joining AIR, Mr. Ligon worked as a certified teacher in the areas of middle school mathematics, special education, health, and physical education. Mr. Ligon has worked with the School District of Hillsborough County, Florida; Prince William County Schools, Virginia; and the District of Columbia Public Schools (DCPS). During his teaching experience, Mr. Ligon taught grades 6–8 mathematics, algebra I, and personal fitness. He also worked as a special educator, developing individual education plans (IEP) and leading IEP meetings for special education students. Mr. Ligon was the math department chair for a K–8 educational campus with DCPS and was a member of the Common Core Math Corp, a group of DCPS educators who worked with central office leadership to design, plan, and implement the Common Core State Standards math rollout. Mr. Ligon received his B.S. in Physical Education with a concentration in Exercise Science from the University of South Florida and his M.Ed. in Educational Leadership with a concentration as a Mathematics Specialist Leader (K–8) from George Mason University.

Kari Thicksten, M.S. Ms. Thicksten has over 10 year of experience in education in grades K–8, specializing in math. Since joining AIR in 2012, Ms. Thicksten has served as a grade level lead for both the Minnesota and Utah projects. She has written and reviewed math items of all grades levels, including 800 previously written items that were realigned to common core for the Utah project. She lead several successful development cycles, producing 300 items for Minnesota and 180 items for Utah in the latest cycles. Ms. Thicksten has led six content and fairness committee reviews for various projects. Ms. Thicksten is a National Board certified teacher in the area of early adolescent mathematics. She holds a M.S in Educational Administration and a B.A. in Elementary Education with a minor in math from Carthage College.

Natalie Morgan, B.S. Ms. Morgan is currently a math test developer at AIR and is responsible for writing, reviewing, and editing math items for various AIR projects. With a focus on algebra, functions, expressions, and equations, she has written and reviewed math items for all grades levels. She has also assisted with aligning over 800 previously written items to the common core. Ms. Morgan has served as a Minnesota grade level lead for grades 7–8 and Utah grade level lead for grades 6–8. She has managed the development of over 500 items for grades 6–8. In addition, Ms. Morgan has experience leading client facing committee meetings and resolving client feedback. Prior to joining AIR, Ms. Morgan worked as an eighth grade mathematics teacher in the Baltimore County Public School system and continued in that position for 6 years. She has experience teaching a variety of math courses from eighth grade math to algebra II. In the Baltimore County Public School system, Ms. Morgan worked as an eighth grade team leader and acted as a liaison between eighth grade staff and administrators; was a University of Maryland, Baltimore County, student teacher mentor; and was a 24 Club advisor. Ms. Morgan holds a B.S. in Education from Slippery Rock University and is currently working on her M.B.A. with an emphasis in leadership.

Leads, High School (Algebra I, Geometry, and Algebra II): Katerina Sagris, Chris Kincheloe, and Roshank Matewere

Katerina Sagris, M.A. Ms. Sagris has more than 9 years of mathematics education experience, with 3 years of experience in educational assessment. At AIR, Ms. Sagris currently serves as the algebra I grade level lead for the Hawaii End-of-Course Assessment, serves as the grade

6–8 lead for the Minnesota State Assessment, and is responsible for all current form building for Delaware. In her roles at AIR, Ms. Sagris is responsible for writing, reviewing, and creating scoring logic for thousands of items. She has facilitated client meetings for middle school item reviews in Utah. Prior to joining AIR, Ms. Sagris worked as a test development specialist at Riverside Publishing in Illinois. In that position, she served in key roles on many projects, including Detroit and Missouri. Ms. Sagris taught high school mathematics and ELA for 5 years with the Chicago Public Schools and for 1 year at East Leyden High School in Schiller Park, Illinois. Ms. Sagris received her B.A. in secondary mathematics and English education at Concordia University, Illinois, and her M.A. in Education with an English language learner teacher certification at Concordia University, Illinois.

Chris Kincheloe, B.S. Mr. Kincheloe has over 5 years of mathematics education experience. At AIR, he serves as a test developer and is responsible for writing, reviewing, and editing math items for various AIR projects, including assessments for Utah, Minnesota, and the Ohio Graduation Test (OGT). He has participated in a content advisory committee meeting and in building forms for the OGT paper test. Prior to joining AIR, Mr. Kincheloe worked at Pearson Education, where he created, tested, and edited online mathematics tutorials and questions for MyMathLab and MathXL, two online homework and test platforms. Mr. Kincheloe received his B.S. in Mathematics from the University of Illinois at Urbana-Champaign.

Roshanak K. Matewere, B.A. Ms. Matewere has 5 years of high school mathematics education experience and nearly 3 years working in education assessment for AIR. In her current role, she writes, reviews, and revises math test items; resolves team and client feedback on test items; and participates in developing machine-scored constructive-response items. She has been involved in the management of the item development for Hawaii, Minnesota, and Utah and the development and alignment of items to the Common Core State Standards. She also has experience leading client facing committee meetings. Mrs. Matewere came to AIR from the classroom, having taught for the Roanoke City Public Schools for 3 years and volunteered with the Peace Corps for 2 years in Malawi, Southeast Africa. She received her B.A. in Mathematics from George Mason University in Fairfax, Virginia, in 2000 and is currently working on her master's in Public Policy with an emphasis in Social Policy from George Mason University in Arlington, Virginia.

Psychometrics and Statistics

Harold Doran, Ph.D., Lead Psychometrician. Dr. Doran is the proposed Psychometrics and Statistics team leader for AIR's support of the Florida Standards Assessments and is responsible for all work conducted by the psychometricians. Working closely with Dr. Gary Phillips, AIR's director for psychometrics and chief psychometrician, Dr. Doran will apply all of the Department-approved technical procedures, finalize all sampling plans, and have final approval over all analyses before submission to the Department. Dr. Doran will also lead and/or oversee the validity work. He will work in close collaboration with the Department and Florida's external psychometric quality control contractors. In addition to supporting the psychometrics of large-scale assessment programs, Dr. Doran is an expert in value-added models, growth models, psychometrics, and state assessment policy. Dr. Doran has helped states complete studies needed for a successful assessment peer review with the federal government, including work for the District of Columbia, Delaware, Hawaii, Indiana, Michigan, Oregon, and Wisconsin. Dr. Doran was appointed by then-Secretary of Education Margaret Spellings to serve on the U.S. Department of Education's National

Technical Advisory Committee, which advises the department on complex technical issues involving the design and implementation of state standards, assessments, and accountability systems. He is the author of the MiscPsycho package in R, which provides miscellaneous psychometric functions for statistical analysis including item response theory estimation.

Elizabeth Ayers, Ph.D., Psychometrician/ Statistician. Dr. Ayers runs operational psychometric work for the Minnesota testing program, where she performs operational and field test calibrations, conducts post-equating, and prepares materials for data review and standard setting. She is also responsible for updating analysis and scoring specification files as well as technical reports and summaries. Prior to joining AIR in early 2012, Dr. Ayers was a post-doctoral researcher at the University of California, Berkeley. While there, she worked for Mark Wilson as project manager for the IES funded Assessing Data Modeling and Statistical Reasoning project. The project, a collaboration with Vanderbilt University, integrates cognitive theories of learning about data and chance with psychometric approaches to modeling student knowledge and skill. In addition, Dr. Ayers worked with Sophia Rabe-Hesketh on extensions of a class of measurement models known as cognitive diagnosis models. This research included model development, estimation using Markov chain Monte Carlo, evaluation of estimators in a variety of scenarios using simulation studies, and application of the methods to real data from the ASSISTment tutor, an online mathematics tutor. Elizabeth holds a Ph.D. in Statistics from Carnegie Mellon University.

Psychometric Research Associates/Assistants

AIR has a team of experienced research associates on our psychometric and statistics team who provide essential support throughout the project life cycle, from forms development and item analyses to standard setting and reporting. For example, they review forms and actually take the completed test using strict protocols before deployment or distribution of assessments. They support all aspects of standard setting and production of technical reports.

Computer and Statistical Sciences Center (Software)

Selina Tolosa, M.B.A., Director, CSSC. As described in the Offeror Profile, Ms. Tolosa leads AIR's Computer and Statistical Sciences Center and has served as team leader for the development and implementation of assessment software systems at AIR for 7 years, including AIR's online test delivery engine and pre-ID and student tracking for all of AIR's clients. Prior to joining AIR, Ms. Tolosa was the director of information services and the financial officer for New American Schools, a nonprofit funding the development of school-wide designs aimed at transforming elementary and secondary schools. Ms. Tolosa brings experience in financial forecasting and analysis; quality assurance of government enterprise systems; and the application of database skills, statistical sampling, and relational databases to data organization of assessment systems. Ms. Tolosa received her M.B.A. from the Wharton School of Business, University of Pennsylvania.

AIR is proposing to implement our proven test delivery, item banking/form construction, student registration, and related systems to support the Florida Standards Assessments. These systems will be configured and deployed for Florida by the following team, which brings experience integrating AIR systems with DRC systems for paper-and-pencil operations and scoring. Each software system at AIR has a lead software project manager and a lead or senior application developer.

- **Software project manager.** In addition to the technical lead, each system or family of systems has a software project manager. The software project manager (SPM) is responsible for ensuring that appropriate protocols are followed, schedules are met, and the software developers have the resources they need to meet their schedules. The SPM serves as the primary liaison to clients and the rest of the project team. The SPM owns the requirements document and the final test plan, working with the developers, quality assurance team, clients, and senior program manager to ensure that the requirements are clear, accurate, and sufficient and that the test plan adequately addresses all requirements. He or she also manages the development schedule, ensuring that resources are allocated appropriately to meet the schedule, notifying the senior program manager of variances from the schedule, and working with the senior program manager and development team to remediate any deadlines that are likely to be missed. Finally, the SPM documents requested changes to the production systems and the testing of those changes, receives technical lead approval for the requested changes, and submits changes to the Production Control Board.
- **Technical lead/senior application developer.** This high-level software engineer takes responsibility for the design and implementation of the systems in his or her area. For each new system or modification to a system, the technical lead works with the team to develop the overall architecture; assign components or modules to senior developers to design, review, and approve detailed requirements and design documents; review and approve unit test and integration test plans; and approve all requests for deployment changes going to the Production Control Board.

The senior project manager and senior application developer for each system are as follows:

Test Delivery

- **Jeremy Fisher, Software Project Manager, Test Delivery, M.S.** (systems development management), B.S. (information systems and technology), 6+ years of experience configuring and delivering TDS in in 20 states.
- **Aaron Newman, Senior Application Developer, M.S.** (Electrical Engineering and Computer Science), 20+ years systems engineering experience; leads high-performance, cross-browser (including mobile) user interfaces for AIR assessments accounting for accessibility, including keyboard accessibility, text-to-speech, ASL, visual impairments, and other special accommodations.

Student Registration

- **Shailesh Gattewar, Software Project Manager, Student Registration, M.B.A. and M.A.** (computer science), PMP, 9+ years of experience as a software project manager and engineer, including 6 years at AIR.
- **Anil Chevuri, Senior Application Developer, B.E.** (electrical engineering), 7+ years of programming experience, including 6 years on AIR's student registration systems for online and paper testing.

Item Banking (ITS)

- **Zorina Alliata, Software Project Manager, Item Banking, M.B.A.**, B.S. (computer science), PMP, 15+ years of experience as a programmer and software project manager directing teams of developers and software support staff.

- **Dipesh Mamtora, Senior Application Developer, M.S. and M.B.A.** (electrical engineering), 10+ years of experience as a senior software engineer, including 6 years at AIR managing three developers in delivering online testing for AIR assessment clients.

Analysis Systems (Quality Monitor and Database of Record)

- **Brian Kane, Software Project Manager, Ph.D.**, PMP (Astronomy), experience in mission-critical IT systems and statistical analysis of large data sets in multi-year longitudinal studies.
- **Paul Van Wamelen, Senior Application Developer, Ph.D.** (mathematics), AIR senior computational statistical specialist with 15+ years of experience in computational number theory; manages the analysis team, which develops and supports the quality analysis and database of record systems.

Under these two main roles, lead developers are responsible for the actual creation of design documents and software, as well as addressing any issues that arise with the production system. Within a team of developers, the lead developer distributes work assignments, oversees the work of other developers, and implements software. The lead developer is responsible for technical direction and the production of design documents from requirements documents, distribution and oversight of work assignments to the development team, review of software modules developed by the development team, direct development of some modules, and contribution to and technical review of test plans.

Finally, each system has data analysts responsible for preparing data in accordance with analysis specifications. In a primarily online program, much of the data analysis is automated, and the data analyst's two main roles involve preparation of data for the field-test analyses and special studies and quality assurance investigations. For this program, the data analyst's main responsibilities include extracting item tryout data, ensuring their quality, and preparing them for analysis by the psychometrics and statistics team; providing periodic quality assurance checks to validate automated quality assurance systems; and preparing analysis files for special analyses, validity studies, and other data sets that may be required by the client or the psychometrics and statistics team/contractor.

Software Quality Assurance for Systems

Software quality assurance (QA) is a critical function. AIR maintains a substantial QA team, and our QA process involves everyone from the senior program manager through the developers and QA engineers and leads. The QA process begins with requirements definition. As requirements for a system or modification are developed, the SPM works with the QA engineer and lead to begin development of the QA design. Once requirements are complete, the SPM, QA lead, QA engineer, and lead developers work together to produce a multifaceted QA plan, which is then implemented during development (unit testing) and after development (integration testing).

Dorian Sofiaj, M.S., Software Quality Assurance Lead. As the lead of software quality assurance, Mr. Sofiaj is responsible for ensuring that every AIR system deployment meets specifications, functions, provides a satisfying user experience, and accurately captures or generates data. He has test responsibility for every system, including AIR's system for item banking, test delivery, electronic reporting, and websites. He develops plans for load testing, interface/functional testing, and data and calculation model testing. He ensures that every system in development has a thorough testing plan that includes automated and

thorough regression testing at scale (rather than on small datasets) and that every system documents procedures to ensure security and confidentiality. Mr. Sofiaj joined AIR after 8+ years in software QA at Fannie Mae, where he progressed to senior technical risk specialist. At Fannie Mae he had managerial and hands-on experience with all aspects of testing, including front end and back end, white box and black box, system, regression, failover, shakeout, and performance testing. He has two M.S. degrees (computer science and physics) and a B.S. degree (mechanical engineering). He has extensive additional training in Oracle/PLSQL, Java, Unix, security, test methodologies, SDLC, management, culture, diversity, and other subjects. Mr. Sofiaj leads AIR's QA team and is responsible for the technical quality of QA plans and their successful implementation, as well as the management and scheduling of the QA testers. He designs the overall architecture of the QA plan, which is embodied in the QA design document, reviews and approves detailed QA plans, and allocates human and hardware resources to implement the QA plan. Under his direction, individual QA leads work with the SPM to draft the QA plan and oversee its implementation. The QA lead participates in the development of the QA design, works on the team led by the SPM to develop the QA plan that implements the QA design, and implements the QA plan, writing automation scripts and overseeing the work of a team of QA testers. Our QA leads on this team have bachelor's degrees (e.g., B.S., commerce with statistics and computers; B.E., electronics and communications), have 8+ years of experience managing software defect-tracking processes, and often hold relevant Microsoft and Cisco certifications.

Network Engineering

As described in our technical approach, AIR supports application hosting with both external and internal resources. AIR hosts our ITS, TDS, reporting, and related critical assessment systems and websites in a managed hosting facility, because the scale and investment available from a dedicated hosting company far exceed what any one company can provide. We use several of Rackspace's managed hosting facilities to host the online testing for Oregon, Delaware, Hawaii, Minnesota, and other smaller efforts, as well as other core AIR assessment systems. Rackspace is rated one of the "Magic Quadrant" leaders by Gartner Research. Internally, AIR has our own staff of network engineers dedicated to our assessment infrastructure. This team is led by **Graham Tapscott, AIR's Network Engineering Lead**, who has 12+ years of experience in network design and maintenance, including 8 years as network engineer for AIR's online testing system. His team includes six additional network engineers, with a combined 60+ years of experience in network engineering, administration, and management for 24/7 mission-critical operational environments, and multiple full-time and part-time tier-2 network help desk support staff.

Computer-Based Testing

Stacy Tsakeris, M.B.A., Project Manager, Computer-Based Testing. At AIR, Ms. Tsakeris is currently managing the quality control for the Smarter Balance computer-based testing across all AIR systems for a consortium of 24 states. This effort includes planning, budgeting, and tracking testing activities, as well as coordinating with AIR software project managers and software engineers for student registration, test delivery, quality assurance, and related systems to ensure quality control. In addition, she is managing the documentation for the Open Source testing software that AIR is developing and delivering to the Open Source repository, which will be available to all Smarter Balanced states. Before joining AIR, Ms. Tsakeris was a consultant who managed various projects in finance, marketing,

education, and the public sector. Most recently, she managed the University of California's Research and Grants Program Office (RGPO) Grants Administration and Management software upgrade. She received her M.B.A. from the University of Maryland and her B.S. in Computer Science and Engineering from The Ohio State University.

Test Administration

Meredith Durgin, B.S., Project Manager, Test Administration. Ms. Durgin has 10 years of management experience in educational assessment, including managing multimillion-dollar projects. At AIR, Ms. Durgin has served as a senior manager for Oregon's very successful online testing project. For example, she led the development of manuals for the 2012–13 school year; developed the project implementation plan for the year; oversaw the annual update of the data exchange interfaces; led AIR's team in district test coordinator training on student registration; completed UAT for both assessments in ELA, math, science, social studies, and English language proficiency; and oversaw the launch of testing. Prior to joining AIR, Ms. Durgin was a senior program manager for Questar Assessment and Houghton Mifflin Harcourt. At Questar, Ms. Durgin served for 2 years as the program director for the Missouri End-of-Course Assessments, an online testing program in algebra I and II, geometry, biology, English I and II, and American History and Government. Her responsibilities included liaison with state departments of education; vendor selection and evaluation; development of program schedules and system design, quality, and consistency; and preparation of materials and data/reporting requirements. At Houghton Mifflin Harcourt, Ms. Durgin served as senior program manager for large-scale contracts for assessment programs in Ohio, New Jersey, New Mexico, Florida, Texas, Missouri, Arkansas, Montana, and Utah, as well as shelf product development. Her responsibilities included the supervision of a program management team to ensure that department and company objectives, goals, and timelines were met; coordinated communications; program design; and scheduling activities across all departments and client organizations. For the Florida Reading First program, Ms. Durgin managed the contract between Riverside and the Florida Department of Education to support districts' administration of the MacGinitie Reading Test to measure growth in different reading skills to help improve reading instruction in grades K–3. Ms. Durgin provided training on administering the test, managing delivery and return of paper/pencil materials, monitoring scoring, and returning results. Ms. Durgin received her B.S. in Elementary Education from the University of Toledo.

Cynthia Benis, B.S., Help Desk Manager. Ms. Benis manages AIR's help desk across all assessment projects, with a focus on support for online testing. Ms. Benis has 25 years of customer service experience, including the last 5 years at AIR leading our help desk across projects. She manages AIR's help desk knowledge bases, inquiry tracking systems, and telephone and electronic communications systems. She oversees full-day support across five time zones for 10,000 monthly inquiries. She manages a team that expands to approximately 50 staff members during peak periods, providing services from 5 a.m. EST to 10 p.m. EST Mondays through Fridays, with occasional Saturday support periods. As the help desk manager, she establishes and enforces processes and best practices, adheres to proper training methodologies and provides staff training, produces management reports, ensures the call center adheres to standards, appropriately communicates project statuses and issues with program management, oversees our clients' service level agreements, and utilizes standard help desk metrics to track and manage work flows. Ms. Benis graduated from The Ohio State University with a B.S. in Marketing.

Scoring and Reporting

Cathy Kugler, B.A., Project Manager, Scoring and Reporting. Ms. Kugler has seven years of assessment experience at AIR, primarily managing data files, team schedules, and deliverables for psychometric and reporting activities on state assessment projects in Ohio and Minnesota. Working closely with the AIR Psychometrics and Statistics and Score Reporting teams, Ms. Kugler's responsibilities include coordinating analysis specifications and reporting documents related to the statistical integrity of state assessments, along with composing and editing technical reports. She has developed and overseen quality control procedures for the implementation of test administration and scoring systems and has performed quality control activities for test construction, scoring, analysis, and score reporting. She also has prepared materials and coordinated logistics for item data review meetings and standard setting workshops. Earlier in her career, Ms. Kugler has served as a statistical support associate and managed tasks such as the transition of technical item banks from the previous testing contractor to AIR. Ms. Kugler received her B.A. in Psychology from the University of Maryland.

Marta Gebrehiwot, B.A., Lead, Score Reporting. AIR proposes that Ms. Gebrehiwot will lead score reporting for the Florida Standards Assessments score reports by working closely with Florida managers and with the AIR Test Development and Psychometrics and Statistics teams. Ms. Gebrehiwot will be responsible for overseeing the design and the printing and delivery of the paper reports. Since joining AIR, Ms. Gebrehiwot has managed three reporting lines by overseeing the day-to-day activities in designing, programming, and producing reports. Since 2010, she has led the production of the state, district, school, and family reports in South Carolina, New Mexico, and other states and the development and delivery of reports from a school climate survey of high school and middle school students in Cleveland. Ms. Gebrehiwot, who has more than seven years of experience in administering standardized tests, including the TOEFL and CLEP exams, received her B.A. in Economics/Management magna cum laude from Dickinson College.

Graphic Designers. As required in the ITN, AIR presented the qualifications and experience of our graphic designers.

DRC Proposed Project Staff

AIR has proposed to subcontract with DRC for the following activities:

- All required hand-scoring of constructed-response items, including associated rangefinding.
- Production, distribution, collection, and processing of all paper/pencil testing.
- Two of the research studies: 7.6.3.3, Transitioning from FCAT 2.0 and EOC Assessments to Florida Standards Assessments (FSA)—Linking the Scales, and 7.6.3.6.1, Investigate the Comparability between Devices Delivering Assessments.

In addition, AIR has included DRC test development specialists to ensure AIR delivers to Florida the broadest range of new items possible.

AIR's Senior Program Manager, Kevin Murphy, will have final responsibility for DRC's work. As described above, DRC's day-to-day hand-scoring and paper/pencil operations will be overseen by AIR's Corporate Director of Operations, Dee Wagner. Dr. Harold Doran will manage DRC's work on the research studies, and our Project Manager for Test Development, Sandra Durden, will ensure that DRC's test development specialists are trained and monitored.

DRC Project Management

Peter Tressel, M.B.C., PMP, Project Manager, Paper/Pencil Operations. Mr. Tressel is a Director, State Assessment Programs at DRC and will serve as DRC's Project Manager, overseeing and facilitating DRC's work on the Florida Standards Assessments. Mr. Tressel has nearly 15 years of project management experience directly related to large-scale, statewide assessment programs. In his current role at DRC, Mr. Tressel provides overall management and direction for assessment programs in Minnesota and Ohio. In addition to his work in the testing industry, Mr. Tressel has more than 20 years of related experience with a variety of writing and editing projects and activities, working with public sector clients (state departments relative to insurance licensure testing) and private sector clients. Mr. Tressel holds a master's degree in Business Communications from the University of St. Thomas in St. Paul, Minnesota, and a Bachelor of Arts degree in Journalism from the University of Minnesota. He is certified as a Project Management Professional (PMP) through the Project Management Institute.

DRC Hand-Scoring

Sherri Woolf, Vice President of Performance Assessment Services. Ms. Woolf will oversee all hand-scoring activities for the project. Ms. Woolf has more than 20 years of educational assessment experience. During her career at DRC, she has managed performance assessment activities for numerous state clients, including Alabama, Arkansas, Kentucky, Louisiana, Minnesota, Nebraska, North Carolina, Ohio, Oklahoma, Pennsylvania, and South Carolina. In addition, Ms. Woolf leads DRC's product development team for strategic planning and execution in innovative items, automated scoring, and artificial intelligence. Ms. Woolf has been instrumental in assisting several of DRC's state clients with transitioning to online assessments, and is keenly interested in the pedagogical implications of online learning and assessment environments. She recently gave a presentation titled "Constructed-Response Scoring and Associated Technologies" to the Technology in Large-Scale Assessment (TILSA) committee of the Council of Chief State School Officers (CCSSO). Ms. Woolf holds an M.S. in Human Resource Development from Xavier University in Cincinnati, Ohio, and a B.S. in Elementary Education from Miami University in Oxford, Ohio. She is a member of Pi Lambda Theta, the International Honor Society and Professional Association in Education.

Wendy Marik, Project Manager, Hand-Scoring. A Senior Project Manager, Performance Assessment Services at DRC, Ms. Marik has 14 years of experience working on large-scale assessment projects. Her primary responsibilities include working closely with state department personnel and educators to develop training materials for scoring writing assessments, monitoring hand-scoring projects and supervising hand-scoring staff, and coordinating rangefinding activities. Ms. Marik has experience with numerous writing assessment models and rubrics. She has worked with clients to implement transition from domain to holistic scoring guidelines. Her prior experience as a classroom teacher helped refine her knowledge of curriculum and standards. During her time at DRC, she has applied her expertise to many statewide assessments in a variety of subject areas, such as writing, mathematics, English language arts, social studies, science, and practical living skills. Ms. Marik earned an M.Ed. from Xavier University in Cincinnati, Ohio, and a B.A. in Computer Science from DePauw University in Greencastle, Indiana.

Pam Ahrens, ELA/Literacy Lead Scoring Director. A Content Specialist for Performance Assessment Services at DRC, Ms. Ahrens has 10 years of hand-scoring experience working

on large-scale assessment projects. Her primary responsibilities include working closely with state department personnel and educators to develop training materials for scoring English language arts and writing assessments, coordinating rangefinding activities in order to ensure accurate and efficient scoring, monitoring hand-scoring projects, and supervising hand-scoring staff. During her time at DRC, Ms. Ahrens has applied her expertise to the subject areas of writing and English language arts, at various elementary and secondary grade levels, as well as for alternative assessment student populations. She has worked on testing programs for Alaska, Arkansas, Louisiana, Minnesota, Ohio, Oklahoma, Pennsylvania, the Smarter Balanced Assessment Consortium, South Carolina, and Washington. Ms. Ahrens' prior experience as a classroom teacher and librarian/information professional helped refine her knowledge of educational assessment, curriculum, and standards. She holds an M.A. in Library Science from the University of Minnesota, as well as a B.S. in Teaching English and Spanish from Mankato State University in Mankato,

Coskun Baysoy, Mathematics Lead Scoring Director. A Mathematics Content Specialist for Performance Assessment Services at DRC, Mr. Baysoy has more than 10 years of progressive leadership experience in large-scale educational testing and performance assessment operations. In his current role, Mr. Baysoy manages all aspects of the scoring operations for the Washington EOC Mathematics Exams. He works closely with state department assessment specialists and educators during planning, development, and scoring phases of the projects; manages internal teams responsible for the development of training materials through external rangefinding activities; develops and monitors scoring processes; and ensures project tasks and milestones are successfully completed. Mr. Baysoy holds a Ph.D., ABD in Electrical and Computer Engineering and an M.S.E.E. in Electrical and Computer Engineering from the University of Minnesota and a B.S.E.E. in Electronics and Communications Engineering from Istanbul Technical University in Istanbul, Turkey.

DRC Paper/Pencil Operations

Doyle Kirkeby, Senior Vice President of Operations. Mr. Kirkeby will provide executive-level oversight of all operations functions for the project. Mr. Kirkeby has more than 40 years of experience in corporate operations management and software development. He has effectively implemented projects and managed staff for a variety of corporate clients. Mr. Kirkeby has been a senior leader in DRC Operations since 1995. He currently serves as the executive in charge of all phases of production scheduling, printing, packaging, materials distribution and collection, warehouse operations, document processing (scanning, editing, and clerical support), and hand-scoring.

Ginny Burnett, Senior Director, Operations—Education. Ms. Burnett will oversee scanning and editing of all answer documents. Ms. Burnett currently serves as DRC's Senior Director, Operations—Education, providing leadership for the timely delivery and processing of education materials. With more than 27 years of experience in operational activities, Ms. Burnett demonstrates a commitment to efficient and innovative management of large-scale assessment projects. Ms. Burnett has implemented quality assurance procedures into the DRC Operations environment and expanded the use of technology into education operations quality functions. Her large-scale assessment experience includes projects for Alabama, Alaska, Georgia, Idaho, Kentucky, Louisiana, North Carolina, Ohio, Oklahoma, Pennsylvania, South Carolina, and Washington. Throughout her career, Ms. Burnett has significantly improved business processes, integrated new technical systems, and provided outstanding project leadership.

Doug Miller, Senior Director of Materials Operations and Logistics. Mr. Miller will oversee all of the packaging, distribution, receipt, and processing of test materials. Mr. Miller manages all aspects of materials packaging and logistics within the DRC Operations group. He is also responsible for the tracking, receipt processing, and inventory for all secure materials associated with DRC's educational assessment projects. Mr. Miller has been responsible for, and successfully fulfilled, all DRC scheduled commitments for delivery of materials and reports since 1998 and has set the bar for exacting standards in test security. He continuously designs and augments existing QC procedures for materials handling operations and regularly partners with the Information Systems group to design and implement technological solutions to complex materials handling issues. Mr. Miller has been instrumental in the development and continued enhancement of the Operations Material Management System, DRC's proprietary materials tracking and security system, and continues his central role in its phased expansion. Mr. Miller holds a Bachelor of Arts degree in English and Psychology from St. Olaf College in Northfield, Minnesota.

DRC Psychometrics

Yi Du, Psychometrician. Dr. Du will lead DRC's work on the research studies. She is a highly respected technical consultant with extensive experience in all aspects of psychometrics, specifically, IRT modeling. She has extensive experience working with a variety of state assessment programs. In her current role at DRC, Dr. Du serves as the Lead Psychometrician for state assessment projects in Louisiana and Michigan and enhances the algorithms in DRC's CAT. Prior to joining DRC, Dr. Du was the director of research and evaluation for the Edina Public School District and assistant director and testing assessment specialist for the Minneapolis Public School District. In addition to her work at DRC, Dr. Du teaches multivariate statistics courses for doctoral programs at the University of Minnesota and the Saint Mary's University as an adjunct professor. She also provides psychometrics consulting for various institutional and licensure/certificate testing companies. Dr. Du holds both a B.S. and an M.S. in Management Information Systems from Beijing University and received her doctorate in Measurement, Evaluation, and Statistical Analysis (MESA) from the University of Chicago where she studied with Dr. Benjamin Wright for Rasch measurement models, with Dr. Darrell Bock for 2-PL and 3-PL IRT models, and with Dr. Anthony Bryk for hierarchical linear modeling.

Christie Plackner, Manager, Psychometric Quality. Ms. Plackner will be responsible for data forensics and psychometric quality. Ms. Plackner has 17 years of educational assessment and research experience. In her current role at DRC, she directs quality initiatives for psychometric services and develops psychometric quality plans for clients. Her experience in large-scale assessment includes: item analysis, calibration, linking, and sampling; conducting analyses related to technical reports; contributing to special studies and reports; facilitating standard setting sessions and committee reviews; and assisting with the development of test forms and providing psychometric sign-off. Ms. Plackner holds an M.A. in Industrial/Organizational Psychology from St. Mary's University in San Antonio, Texas, and a B.S. in Psychology from Valparaiso University in Valparaiso, Indiana. She is currently pursuing a Ph.D. in Educational Psychology focusing on quantitative methods in education from the University of Minnesota.

DRC Test Development

Patricia McDivitt, Senior Vice President of Curriculum, Instruction, and Assessment. Ms. McDivitt will provide executive-level sup-

port and guidance for all test development activities for the project. She has more than 25 years of direct, hands-on educational curriculum, instruction, and assessment development experience. Ms. McDivitt oversees all phases of the item and test development process for K–12 large-scale assessment programs in content areas such as reading, English language arts, science, mathematics, and civics and government. She also oversees the development of assessment ancillaries, including the development of curriculum units and lesson plans designed to link assessment results to instruction. Ms. McDivitt has direct CCSS experience with programs in Alabama, Alaska, Louisiana, and Pennsylvania, providing guidance and oversight for all of DRC's work. Ms. McDivitt earned an M.S. in Education, School Guidance and Counseling, and Secondary Teaching in English Language Arts with a Special Education Endorsement, and a B.S. in Secondary Education English Language Arts, both from Indiana University in Bloomington, Indiana.

James Bell, Senior ELA Test Development Content Specialist. Dr. Bell will lead ELA development activities assigned to DRC. Dr. Bell has more than 25 years of experience in education and assessment. At DRC, he participates in all aspects of English language arts test and item development. Dr. Bell has direct CCSS experience with programs in Louisiana and for the Smarter Balanced Assessment Consortium. Prior to taking a full-time position at DRC, Dr. Bell served as chair and associate professor in the Department of English, Foreign Language and Humanities at Northwestern Oklahoma State University. He has also served as director of institutional assessment and associate professor at College of the Ozarks, and as a freelance English language arts writer, editor, and facilitator in assessment. He has extensive experience as a writing consultant for elementary and secondary schools, conducting workshops and on-site visits related to standardized test development and review, secondary writing center design, the writing process, and authentic analogies for the writing process. Dr. Bell holds a Ph.D. in English from Texas Tech University in Lubbock, Texas; an M.A. in English and Drama from Texas Woman's University in Denton, Texas; and a B.S. in Secondary Education in English and Psychology from Lamar University in Beaumont, Texas.

Anne Kirpes, ELA Content Specialist. Ms. Kirpes will assist Dr. Bell with ELA development activities for DRC. Ms. Kirpes has 15 years of reading and language arts test development experience at all grade levels. As DRC's Reading Test Development Director, she provides subject-specific expertise relative to all stages of the test development process. She has worked on more than 10 statewide assessments, including providing leadership as team lead and/or content lead. Ms. Kirpes has direct CCSS experience working with Alabama, Alaska, Louisiana, Pennsylvania, and the Smarter Balanced Assessment Consortium. Ms. Kirpes' assessment experience ranges from test design to standard setting, including directing and participating in item/rubric development and test construction, participating in performance assessment scoring processes, facilitating and participating in standard setting, and facilitating rangefinding and data committee reviews. In addition to her comprehensive experience in large-scale assessment, Ms. Kirpes has eight years of teaching experience at the elementary level. Ms. Kirpes earned an Ed.M. with a concentration in Teaching and Learning from Harvard University Graduate School of Education. She also holds a B.A. in Elementary Education, Reading/Language Arts, from the University of Northern Iowa.

John Selisky, Mathematics Content Lead. Dr. Selisky will lead Mathematics development activities assigned to DRC. Dr. Selisky has 17

years of test development and educational measurement experience and more than 25 years of teaching experience. In his current role as Director, Test Development for Mathematics, Dr. Selisky oversees all aspects of mathematics item and test development. He has written and developed a variety of ancillary products in support of assessment programs; conducted training presentations, committee reviews, and analytical procedures for educators and measurement professionals; and trained and mentored assessment professionals in item writing and development, test construction, and data analysis. He has direct CCSS and CCRS experience working with Louisiana, Michigan, Pennsylvania, and the Smarter Balanced Assessment Consortium. Dr. Selisky holds an Ed.D. in Mathematics Education and an M.A. in Instructional Technology from the Teachers College, Columbia University in New York, New York; an M.A. in Secondary Education from Lehigh University in Bethlehem, Pennsylvania; and B.S. degrees in Earth and Planetary Sciences and Mathematics from University of Pittsburgh in Pittsburgh, Pennsylvania.

Christopher Peterson, Mathematics Content Specialist. Mr. Peterson will assist Dr. Selisky with mathematics development activities for DRC. Mr. Peterson has six years of experience in large-scale, statewide assessments and is an important contributor to the test development process at DRC. He has participated in DRC's work for assessments in Alabama, Louisiana, Michigan, Pennsylvania, and South Carolina. Mr. Peterson has direct CCSS experience with Louisiana, Pennsylvania, and the Smarter Balanced Assessment Consortium. Mr. Peterson helped establish the test development group at DRC. He was responsible for quality testing several assessment projects and working with psychometric data to make informed decisions about item and test development. Mr. Peterson recently returned to the large-scale, statewide assessment industry after spending eight years in the middle school mathematics classroom. His experience there included teaching pre-algebra and algebra for grades 6 and 7 students in both the accelerated and the traditional classroom. He has also worked extensively with special needs students in grades 6 through 9 mathematics classrooms, including teaching geometry curriculum. He holds a M.Ed. degree in Teaching from the University of St. Thomas in Minneapolis, Minnesota, and a B.S in Mathematics from Wheaton College in Wheaton, Illinois.

7.7.3 Subcontractors

As described throughout this proposal, AIR will engage DRC as a subcontractor. We have included documentation of DRC's experience and personnel (e.g., resumes) alongside AIR's experience and staff.

AIR understands we assume full responsibility for all services and communications, including those delegated to subcontractors. Further, we understand any proposed changes in subcontractors must be approved by Florida in advance and that no subcontracted work (or any work) related to customer service or to any secure document or data will be provided by a persons or agencies physically located outside of the United States.

In addition to DRC as our partner for hand-scoring and paper-and-pencil operations (including the printing of all scannable documents), AIR expects to engage subcontractors for the following activities:

- Rackspace, for managed hosting services, supports AIR's online testing in 20+ states.
- Bradford & Bigelow and RR Donnelley, for the printing of nonscannable materials, have printed more than 100 million pages of materials each year for secure testing programs.

- Automated Graphics Solutions (AGS), for the printing of score reports, has printed more than 4 million pages of score reports for AIR each year, using AIR's documented processes and strict quality control procedures.
- United Parcel Service (UPS) and King Solutions, for shipping, have supported AIR and DRC in 15+ states.
- American Printing House for the Blind (APH), for Braille-related services, has successfully provided services to AIR and DRC on multiple state projects.

We have included detailed processes to be used with each of these subcontractors in the relevant sections of the technical proposal. Please see Exhibit 7.7.3-1 for the subcontractor roles and qualifications.

AIR's successful subcontracting is based on three critical components:

- Clear delineation of responsibility and expectations
- Accountability mechanisms
- Trust and integrity on the part of each player

AIR's formal subcontract agreements outline its commitments, which include an acknowledgment of the required documents, areas of responsibility, and the products for which the subcontractor is responsible. AIR staff review subcontractor work and hold it to the same high standards as AIR holds itself. This formal, clear communication of expectations details the means by which developed products will be deemed acceptable. Please see Exhibit 7.7.3-1 for the role and qualifications of the proposed subcontractors.

Finally, in addition to these subcontractors, AIR also engages many vendors for various services in support of projects. These include communications (e.g., VOIP, WebEx, cell phones), routine mailing (e.g., USPS, Federal Express), internal copying (e.g., Xerox, Océ), temporary employment agencies, supplies, and many other services required to support our staff and project work. Although not specifically procured for this project, AIR treats these agreements in the same manner described above at a corporate level. We procure these services after careful analysis and/or competition, develop formal contractual agreements, and have designated accountability and review procedures.

Exhibit 7.7.3-1: Proposed Subcontractor Roles and Qualifications

Subcontractor/Role	Qualifications
Automated Graphics Solutions (AGS) *Printing Score Reports*	AGS, part of the CGX family, is the world's leading provider of digital print solutions. With a growing fleet of 242 state-of the-art digital presses across North America, and in Prague and Asia, the AGS/CGX network continues to expand its digital footprint with breakthrough technologies. AGS has led AIR's printing of full-color digital print score reports for nearly a decade. AGS equipment includes the largest network of Xerox iGens and five high-speed, inkjet web presses for high-volume, variable data needs, and easily produces millions of pages of score reports.
The American Printing House for the Blind (APH) *Creating Braille Materials*	APH, founded in 1858, is the world's largest nonprofit organization creating educational, workplace, and independent living products and services for people who are blind and visually impaired. APH's mission is to promote the independence of blind and visually impaired persons by providing specialized materials, products, and services needed for education and life. APH has adapted and produced tests in accessible media for over 50 years. In 2002, APH became a member of the Association of Test Publishers (ATP). APH has produced Braille tests or test-related tools for numerous statewide assessment programs in states such as Alaska, Arizona, California, Florida, Illinois, Kentucky, Massachusetts, Michigan, Minnesota, New York, South Carolina, and Tennessee.
Bradford and Bigelow (B&B) *Printing Non-Scannable Documents*	Bradford & Bigelow (B&B) provides a supply chain solution for publishers. Their market focus and the innovative technology of the Digital Book Factory with seamless integration into the B&B/Timson Press Platform provide the speed, capacity, and redundancy for their publishers to significantly reduce lead times, back orders, obsolescence, and shipping and administrative costs. B&B is a complete, environmentally responsible supply chain solution. B&B recycles more than 5 MM pounds of paper and 100 K aluminum plates per hour. Their recycling efforts annually preserve 68,000 trees and 321,000 cubic feet of landfill space. Almost every piece of material that enters their facility is sold as a finished product, or recycled for future use. Their custom-built recycling system removes essentially all paper dust from the plant, creating a healthier work environment for their employees.
King Solutions *Shipping Test Materials*	Over 20 years ago, founders Mike Patterson and Meyer Bolnick saw a need in the transportation industry and they decided to fill it. So in 1989, they established King Solutions as a values-based organization committed to a customer-focused approach. Since then, King has become a leading provider of international freight transportation, retail project management, global logistics, mail consolidation, fulfillment, warehousing, and more.
Rackspace *Managed Hosting Services*	Rackspace is rated one of the "Magic Quadrant" leaders by Gartner Research. Rackspace secured facilities are designed with redundancy at every potential point of failure. Multiple redundant Tier 1 Internet connections, router and switch configuration, real-time and backup power supplies are just examples of the components of Rackspace's Business Continuity Plan (BCP). Rackspace delivers the best network performance in the industry, using only quality bandwidth from Tier 1 backbone providers and has multi-gigabytes of high quality provisioned data capacity with virtually unlimited scalability. Based on AIR's unique system design, AIR's contract with Rackspace guarantees 100% uptime. We believe this is unique in the assessment industry.
RR Donnelly *Printing Non-scannable documents*	Founded in 1864, RR Donnelley is the world's premier full-service provider of print and related services, including business process outsourcing. With more than 55,000 employees worldwide, the company provides solutions in commercial printing, direct mail, financial printing, print fulfillment, forms and labels, logistics, call centers, transactional print-and-mail, print management, online services, digital photography, color services, and content and database management to customers in publishing, healthcare, advertising, retail, technology, financial services, and many other industries. RR Donnelley has extensive experience working with large-scale assessment vendors around the country to provide printing services for secure test material.
United Parcel Service (UPS) *Shipping Test Materials*	UPS, founded in 1907, is the world's largest package delivery company and a leading global provider of specialized transportation and logistics services. UPS has grown into a multi-billion dollar corporation by clearly focusing on the goal of enabling commerce around the globe. Every day, more than 399,000 employees worldwide manage the flow of goods, funds, and information in more than 200 countries and territories worldwide. AIR and DRC have developed an excellent working relationship with UPS and have worked together to guarantee the delivery and pickup of materials for more than 20 educational assessment programs.

7.7.4 Program Management Communication

Program management communication is critical to the success of the project. While meetings and calls are important, the documentation resulting from these events is just as critical. AIR maintains a comprehensive suite of specifications documents designed to capture decisions in a systematic way and ensure that those decisions are reviewed by the technical experts whose work they may impact. In Section 7.7.6 we describe these management communication documents and the tools we maintain to ensure that all specifications and decisions are accurately documented.

Here, we focus on the management meetings themselves. A more complete view of our management communication process is presented in Section 7.7.5.

Led by the senior program manager, AIR will host the weekly Department/AIR program update conference calls to discuss the period's progress and to identify upcoming deadlines and possible challenges. During peak intervals in the project schedule, AIR proposes to host the meetings more frequently, if necessary.

The project plan and schedule, the policy decisions that need to be made, and the upcoming tasks and timelines that need to be met will be reviewed. At each meeting, the Department will receive general progress updates from each team leader. The Department will have the opportunity to speak directly with AIR's Technical, Systems Engineering, Item Development, Operations, and Project Management team leaders.

Decisions made during the meeting will be documented in the appropriate specifications document and in the weekly meeting minutes. Changed specifications will be circulated among internal and Department stakeholders before the decision becomes final. In this way, we ensure that (a) the entire team is aware of the change and (b) each functional group has an opportunity to identify risks or issues that may arise as a result of a change in another functional area.

AIR maintains a suite of communication tools and services to support project communication. AIR will provide a toll-free conference line for all Department/AIR project-related conference calls. AIR offers web-conferencing solutions that enhance a virtual meeting.

To conduct virtual meetings, appropriate technology needs to be in place. AIR has made significant investments in the hardware, software, and connectivity required to support virtual meetings. We use well-known industry-standard solutions that are easily accessible.

AIR offers all the services listed below in this section. We have a nimble Conference Services team and will adapt to existing virtual conferencing systems as needed. Because AIR has offices around the world and already works with stakeholders in multiple locations, the AIR staff are very familiar with these solutions. The offerings listed below require minimal support. During the course of the project and the different types of meetings, AIR will help select the right tool for the right event.

CISCO's WebEx may provide the best option and will facilitate meetings involving attendees in multiple locations. Again, AIR will adapt to existing conference services solutions as needed. Web-Ex connects us with real-time, online webinars and telephone conferencing. Whether we are meeting with the Department staff or assisting in training state personnel or even local staff, WebEx will assist us in connecting. In addition to sharing presentation slides, participating in live video, and recording events, attendees can interact with each another,

regardless of the size of the meeting, using a live Q&A.

In addition to WebEx, which offers video and audio conferencing, instant messaging and desktop sharing, AIR offers the following virtual conference services solutions:

The **Global Crossing Conference Phone Line** is a traditional audio conference line and may be suited for smaller Department/AIR meetings.

Increasing in popularity, **Skype** offers video and audio conferencing, instant messaging, and desktop sharing. Skype is easily downloaded and requires little technical support. A user guide and a tutorial are available to assist users accessing Skype.

For complete video conferencing between multiple locations, AIR offers **Tandberg Video Conferencing Services**. Although this solution requires local support (e.g., video cameras, connectivity), Cisco's Tandberg offers screen-based video communication systems that enhance our ability to communicate objectives for a particular meeting.

AIR will maintain a KnowledgeTree site for the Department. Before deploying documents to the site, AIR will propose a list of users and their access rights. The Department will have an opportunity to modify this list before providing final approval.

Additionally AIR proposes to establish a Secure File Transfer Protocol (SFTP) site for the transfer of large databases and secure materials. The SFTP site offers an efficient mechanism for transferring large-scale data. An SFTP site will also be available for transfer of documents and data that do not require the version control of KnowledgeTree. This will be available to both the Department and the field as needed. Such transfers do not require the workflow or overhead associated with the KnowledgeTree site. AIR will maintain the same users across systems.

Annually and upon request, AIR will provide complete lists of users for the Department to review and will eliminate or add users on request. AIR will work with the Department to configure the system with user roles and respective file permissions.

When Department staff visit AIR they will be assigned a visitor's office. These are the same offices that AIR remote staff use when visiting the DC office and are lockable. They include a telephone with a speaker. Fax machines are available on every floor and can be arranged for at need. Department staff will have access to printers.

7.7.5 Program Management Meetings

AIR understands that in order for this project to be successful, we will need to collaborate with many stakeholders. AIR will make every effort to be flexible, provide information as required, and keep this important project on track. We are prepared to participate in regular management meetings, either at our own facilities or at a mutually agreed-upon location, and to send up to 15 of our staff members to at least two project management meetings per year. All necessary AIR staff will attend up to four project-specific meetings. DRC representatives will also attend these meetings, as appropriate.

AIR will be responsible for all logistics and facilities as well as the travel cost for AIR and DRC staff, as required. If electronic participation is required, AIR can facilitate this logistic, as needed; our remote conferencing solutions are described in detail in Section 7.7.4. Additionally, AIR will be responsible for the travel and lodging cost of up to 10 Department staff up to 15 times a year, as needed.

AIR believes that open collaboration with the Department and other stakeholders is critical to a productive relationship that fosters good decision making and a common understanding of program priorities. Below we propose a communications plan that will help achieve those goals.

Communications Plan

Upon award of the contract, AIR will travel to Tallahassee to meet with the Department within 30 days after the contract is finalized. At that time, we will work with the Department to develop a communications plan that specifies

- who needs to receive specific information;
- when that information needs to be communicated (on a specific date or at regular intervals);
- the person responsible for communicating the information;
- the method used to communicate the information; and
- the processes for documentation that the information has been communicated and sign-offs have been received (if applicable).

AIR will create the project's organizational chart, which will include all key team members, their contact information for immediate access, and the chain-of-command contact information. AIR will assist the Department in designing a comparable project-based organizational chart, if desired, so that contact information is at everyone's fingertips.

Additionally, we recognize the importance of adhering to an agreed-upon escalation protocol. AIR will coordinate with the Department during the resolution of all escalated issues to ensure timely resolution and communication with impacted users of the assessment system. We will also work closely with the Department to develop and document an effective strategy for ensuring the Department's advance notice of changes that may disrupt service to users of the online system.

Please see Appendix H for a sample communications plan.

Real-Time Communication with the Department

AIR's program manager will proactively communicate with the Department staff in advance of changes that may disrupt service in locations required to administer the state assessment. In addition to the formal communications plans identified in this section, the program manager will stay in close contact with the Department staff, informing them of any project change that might impact schedule or deliverables. AIR will report all system errors to the Department within 24 hours.

Weekly Meetings

In Section 7.7.4, AIR detailed our proposal to host weekly program update conference calls wherein the Department and AIR will discuss the project plan and schedule, the policy decisions that need to be made, and the upcoming tasks and timelines. Decisions made during the meeting will be documented in the appropriate specifications document and in the weekly meeting minutes. Additionally, as discussed in greater detail in Section 7.7.6, AIR will maintain an issues log to document issues across the weekly meetings. The issues log will be updated continuously and will document the resolution of each issue.

Face-to-Face Meetings

AIR will work with the Department to schedule monthly in-person meetings between the Department's program manager and AIR's program manager, as needed.

Annual Planning Meetings

AIR proposes a two-day, AIR-sponsored annual planning meeting, during which the Department and AIR will review schedules for the upcoming year and establish the baseline plan. Attendees include the program manager and leads in each area. AIR will draft an agenda for review and revision by the Department. This meeting may coincide with one of the comprehensive program management meetings or it may be scheduled separately.

Communication across Teams at AIR

In addition to communication with the Department, it is essential to have proper channels of communication internally to accomplish the described work. AIR conducts several agenda-driven and efficiently run meetings across teams.

Each team leader also has communication channels within his or her staff. Team leaders meet with their staff or senior staff members and share relevant information from the weekly team leaders meeting, as well as discuss team-specific issues.

Each team is linked by a project calendar maintained by AIR's program manager and team leaders. The calendar is accessible to all project members.

AIR encourages collaboration among and within teams. Because of their frequent interaction, team members are well-versed in the responsibilities of other teams. Each team's processes and procedures are codified and placed on a shared file directory. The processes and procedures are written so that each new team member can easily contribute to the team without having to overcome a steep learning curve.

Teams are not segregated. To ensure message consistency, staff members will regularly participate in other team or breakout meetings as well as attend the program update conference calls between the Department and AIR.

The goals of the project, along with the necessary steps needed to achieve those goals, are communicated to the staff weekly. The result is a cohesive project-wide plan communicated by senior leadership that also contains the task specificity provided by the staff members of each team to accomplish the deliverables.

7.7.6 Program Management Reports

Key to a successful online assessment administration is proper documentation and tracking. AIR understands the Department requires five types of reports to facilitate and document program management communications, as follows:

- *Program Schedule*
  AIR produces schedules on three levels. At the Program level, we produce the overall Program Schedule. The Program Schedule documents work-start and completion/delivery dates for key activities, milestones, and deliverables. We typically maintain the Program Schedule in Microsoft Project internally and will deliver the schedule to the Department in Microsoft Excel format, as required by the ITN. A preliminary Program Schedule for this project appears in Section 7.1.2.

  At the next level, we have "team schedules." For example, our Test Development team will work with key content personnel at the Department to develop detailed committee meeting schedules and batch delivery schedules that document the dates that batches of items will be delivered for review.

The Psychometrics and Statistics team develops an analysis schedule, which identifies milestones in the data receipt, analysis, and delivery schedules. Some of these schedules are entirely internal, designed to enable us to meet the milestones on the project schedule.

The third level, task-specific schedules such as the quality control of scoring data, include tasks that require interaction with the Department, and these schedules will be developed in collaboration with the appropriate Department staff.

- *Weekly Management and Action Item Reports*
  Our Program Management team will produce and manage the Weekly Management and Action Item Report. This report will summarize, on a weekly basis, the current status of the program, including status on milestones and critical tasks, change management, risk management, and a review of the current issues log. We look forward to working with the Department in formalizing a format and structure of this report.
- *Technical Report*
  The Technical Report will be developed by our Psychometrics and Statistics team. Details on the Technical Report can be found in Section 7.6.3.
- *Annual Program Review and Accounting Reports*
  Information pertaining to the Annual Program Review and Accounting Reports is summarized following the discussion of our set of additional program management reports and documents and our management approach.

AIR is committed to providing each of these reports. In our experience with other online assessment programs, we have come to understand that programs with similar size and scope require a substantial amount of additional documentation. Below we describe, in detail, the management documentation that communicates and documents the decisions that comprise the overall program design.

Management Documents

AIR has developed a series of tools that enable our project directors and managers to analyze the project requirements. These tools form the basis for clear, open, and accessible communication about the project schedule, deliverables, and specific requirements. Our Program Managers function as coordinators among the technical experts in our other functional areas, much as a general contractor orchestrates the work of specialized subcontractors on a construction job.

The suite includes four types of tools that program directors use to orchestrate the work of the project:

- Schedules
- Planning Documents
- Tracking Documents
- Specification Documents

AIR's various **scheduling tools** have been outlined above.

Planning documents kick off complex activities. They outline the general approach to the activity, assign responsibilities, and establish milestones. Some of these milestones may be further specification documents or elements needed to complete the plan. For example, the senior program manager produces an administration summary for each administration, outlining the basics of the administration, including characteristics such as the grades and subjects available for testing, the number of opportunities offered for each, the number of field-test items to be included, and the start and end of the administration period. The Test

Development team uses this document as a starting point for their item development plan, and the Psychometrics and Statistics team uses this document to begin their field-test plan and analysis schedule.

Our Program Management team relies on several **tracking documents** to monitor project status, coordinate work among internal teams, and communicate progress toward milestones to our clients. For example, to coordinate the multitude of deliverables exchanged between AIR and our clients, our operations lead maintains (and shares with our clients) a priority list of deliverables that are currently in play (e.g., blackline 1 of the Test Administration Manual). The priority list identifies the document name, the responsible party, the date the document is due to be returned, and the date the document is due to be finalized. This document also assigns a priority level to help clients manage and prioritize work during busier times in the schedule.

Our team leads work with our clients to develop detailed **specification documents**. Specification documents function as the detailed requirements documents for each phase of the program. For example, our Reporting team will work with the Department staff to develop a detailed reporting specifications document, which includes lists of reports to be produced, descriptions of report recipients, packaging specifications for paper reports, calculation rules for each data element, and other fine details of the reporting system. This document is usually created in collaboration with the lead psychometrician and the technical, content, and leadership staff at the Department.

Each document has an owner and a list of stakeholders. The owner is the person responsible for keeping the document up-to-date and ensuring that all stakeholders sign off on any changes to the document. Stakeholders include project team members whose work depends directly or indirectly on the work described in the document. In almost every case, client staff members are stakeholders in these documents as well.

Exhibits 7.7.6-1 through 7.7.6-4 summarize our standard schedule documents, planning documents, tracking documents, and specification documents.

Repository for Management Documents

Given the complex nature of assessment projects, the multitude of documents alone, not including the review and approval process of iterations of these documents, can be a challenge to maintain using traditional share-drive options found in most organizations. Therefore, AIR proposes that all major project documents, in particular those documents identified in Exhibits 7.7.6-1 through 7.7.6-4 (Management Documents), be stored on KnowledgeTree.

KnowledgeTree is an online document management system on a secure cloud computing platform. KnowledgeTree manages document workflow and file sharing, alerts document followers to changes, and maintains version control, including authors and document history. Documents are checked in and checked out for editing. Access to documents can be controlled through a user roles and permissions system.

This project will start with a clean slate of project documents. Managing documents through KnowledgeTree from the kickoff will increase productivity, increase efficiency, reduce error and miscommunication, provide a single reference point for all documents that house key project decisions, and lead to a higher degree of collaboration across internal teams and across our organizations.

KnowledgeTree has three distinguishing features:

1. **Ease of use:** A document management system can be effective only if it can be sustainably used by all users of varying technical ability. KnowledgeTree is user friendly and requires little to no training (even for nontechnical users). For example, creating files by authorized users is as intuitive as doing these same tasks on Windows Explorer.
2. **Workflow management:** The process of fully vetting specification and schedule changes is both complicated and critical. Our process allows participants to identify a stake in a document, thereby becoming stakeholders. Proposed changes are automatically circulated among stakeholders for review and approval. This provides an opportunity for those who must accomplish the work to identify dependencies or implications that may have been initially overlooked.
3. **Built-in version control system:** Documents can be checked in and checked out for editing. Review workflows can also be built into each document type. AIR proposes to establish a secure FTP (SFTP) site for the transfer of large, secure databases. SFTP offers an efficient mechanism for transferring large-scale data. Such transfers do not require the workflow or overhead associated with the KnowledgeTree site. AIR will maintain the same users across systems.

AIR will maintain the KnowledgeTree and SFTP sites. Before deploying documents to the site, AIR will propose a list of users and their access rights. The Department will have an opportunity to modify this list before providing final approval.

Annually and on request, AIR will provide complete lists of users for the Department's review and will eliminate or add users at its request. AIR will work with the Department to configure the system with user roles and respective file permissions. KnowledgeTree can be programmed to have a hierarchy that is arbitrarily deep.

Change Management

The purpose of change management is to ensure that changes are communicated, managed, and controlled. This is accomplished by working with the Department to clearly define the change control processes during the planning stage so that when the inevitable change requests surface, there will be no confusion about roles, responsibilities, and process requirements. Otherwise, uncontrolled change management can negatively impact budget, scope, schedules, and possibly quality.

We recognize that plans and objectives can change frequently. Therefore, we have a structured process for gathering, tracking, and disseminating changes to these documents. These include regular planning meetings, project updates, issues logs, and other tools.

Weekly conference call meetings between AIR and the Department cover near-term deliverables and address issues as they arise. In addition, the AIR Program Manager will produce weekly reports for the Department that will include status of items such as deliverables, key accomplishments, upcoming activities, any changes to the schedule, or any issues. AIR will deliver the weekly status report via email. Decisions are documented in the meeting minutes and in the issues log, which is updated weekly and tracks issues and near-term deliverables. It notes progress, problems, risks, and assignments.

A potential change will be identified and documented on a change request form and sent to the Program Manager. The Program Manager

Exhibit 7.7.6-1: Schedule Documents

Team	Document	Description	Owner
Management	Program Schedule	Defines project milestones; start dates for activities	Program Manager
Management	Production Schedule	Details timelines for review and approval of items, forms, user guides, and ancillary materials	Program Manager
Psychometrics and Statistics	Analysis Schedule	Lists schedule of data flows and analysis activities	Lead Psychometrician
Operations	Delivery Schedule	Details milestones for packaging and shipping materials	Operations Lead
Operations	Receipt and Scoring Schedule	Defines milestones for document receipt, scanning, and scoring	Operations Lead
Test Development	Batch Delivery Schedule	Lists dates for delivery of item batches and item reviews	Item Development Manager
Test Development	Committee Meeting Schedule	Lists dates and milestones for the preparation and convening of annual committee meetings	Item Development Manager
Computer and Statistical Sciences Center (CSSC)	Development and Deployment Schedules	Outlines schedules for development and deployment	Software Project Manager

Exhibit 7.7.6-2: Planning Documents

Team	Document	Description	Owner
Management	Project implementation plan	Summarizes the overall project, including all deliverables, goals, milestones, grades, subjects tested, and modes of testing	Program Manager
Management	Administration summary	Lists characteristics of the administration, such as grades and subjects available for testing, the number of opportunities offered for each, the number of field-test items to be included, and the start and end of the administration period	Program Manager
Psychometrics and Statistics	Field-test plan	Describes the sampling methods used to field test items, the statistics used to analyze them, the ways in which risks of item exposure will be mitigated, and other aspects of the field-test plan	Lead Psychometrician
Psychometrics and Statistics	Analysis plan	Lists objectives of the analysis and the specific analysis methods for calibration and linking for operational psychometrics; special analyses such as generalizability analyses, comparability studies, etc., are described in each study's individual analysis plan	Lead Psychometrician or Study Lead
Psychometrics and Statistics	Standard-setting plan	Details the standard-setting workshops, including text of instructions to panelists, statistical analyses, and construction of item booklets	Standard-setting Lead
Operations	Special version summary	Summarizes the special versions to be offered, including translations, alternate language audio, Braille; details the requirements for each test	Program Manager
Operations	Ancillary abstract	Summarizes ancillary documents to be developed, including administration guides, user manuals and other materials; includes special instructions or requirements	Program Manager
Test Development	Annual pool analysis and development plan	Describes annual charts summarizing the state of the item pool relative to the requirements of the item pool or forms to be deployed the subsequent year	Item Development Manager
Test Development	Committee meeting summary sheet	Summarizes committee meetings, including the number of items to be reviewed, number of committee members, dates	Item Development Manager

Exhibit 7.7.6-2: Planning Documents (continued)

CSSC	Project charter	Describes the goals, approach, and nature of new systems or system modifications	Software Project Manager
CSSC	Testing design	Details the design document describing the testing strategies to be employed for a new system or the modifications to an existing system; lays the groundwork for the test plan	Software Project Manager
CSSC	Test plans	Details plans for load testing, individual test cases, and regression tests to be implemented	Software Project Manager
CSSC	Software release plans	Lists step-by-step activities for Software Development team and Network Engineering teams to deploy software systems for scheduled releases	Software Project Manager
CSSC	Production control forms	Lists steps required by AIR's Production Control Board for evaluating and approving the test plans for a configuration change in the middle of the year in production systems	Software Project Manager
Reporting	Reporting goals	Lists objectives of the elements to be included in the report; describes the goals and the types of actions that the report might motivate, and suggests data elements that might support those actions	Reporting Lead

Exhibit 7.7.6-3: Tracking Documents

Team	Document	Description	Owner
Management	Issues Log	Updated weekly; tracks issues and near-term deliverables; and notes progress, problems, risks, assignment, and agreed-upon changes to scope or progress	Program Manager
Management	Priority List	Lists the testing and administration documents currently being exchanged between AIR and the Department; assigns a priority value to each document; identifies the document's review level and due dates	Program Manager
Management	Risk Register	Identifies and classifies project risks, organized by function and area; summarizes proposed mitigation strategies	Program Manager
Test Development	Item Release List	Lists specific items to be released each year for each subject	Lead Psychometrician, Item Development Manager
Test Development	Batch Delivery Tracking Sheet	Tracks the item batches by grade and subject, including the number of items in each batch, number of items accepted, and number of items accepted with revisions; tracks due dates	Item Development Manager

Exhibit 7.7.6-4: Specification Documents

Team	Document	Description	Owner
Psychometrics and Statistics	Analysis specifications	Describes the details of analyses, including software settings, locations of data files, and many others	Lead Psychometrician
Psychometrics and Statistics	QC specifications	Identifies quality control-specific analyses and comparisons to be undertaken	Lead Psychometrician
Psychometrics and Statistics	Scoring-engine specifications	Summarizes scores to be reported at various levels, attemptedness rules, and scoring computations that are performed by the test-scoring engine for all tests	Lead Psychometrician
Psychometrics and Statistics and Test Development	Test specifications	Includes test blueprints, item specifications, and style guides	Lead Psychometrician, Item Development Manager
Test Development	Field-test summary	Shows numbers and types of items to be field-tested each year and form construction details	Item Development Manager
Test Development	Item Tracking System (ITS) specifications	Defines the attributes to be collected for each item, the content review sequences, and the item layout templates	Item Development Manager
Operations	Packaging specifications	Describes materials to be shipped, shipping carrier, expected packing list format, materials to be packed, and details of packaging	Packaging and Shipping Manager
Operations	Receipt specifications	Details secure and nonsecure documents to be received, expected quantity, receipt start and end dates, and special instructions	Packaging and Shipping Manager
Operations	Scoring specifications	Identifies human-scored constructed-response items, the dimensions and points on which items are scored, condition codes for unscored responses, backread and second-read rates, frequency of validity papers, and target reliability and validity statistics	Scoring Director
CSSC	Requirement documents	Defines the detailed requirements for the software or software modification to be implemented	Software Project Manager
CSSC	Test Information Distribution Engine (TIDE) specifications	Defines detailed requirements for materials ordering, student management, and user management, including user roles within the suite of online testing applications	Software Project Manager
CSSC	Data file generator specifications	Defines detailed requirements for student and item-score files delivered after testing	Software Project Manager
CSSC	Learning Point Navigator specifications	Defines detailed requirements for AIR's Learning Point Navigator, which provides instructional resources targeted to identified areas of strengths and weaknesses	Software Project Manager

Exhibit 7.7.6-4: Specification Documents (continued)

CSSC	Online Project Portal specifications	Defines the layout, skin/theme, user cards, and content sections	Software Project Manager
CSSC	Test Delivery System specifications	Defines the test settings for the Proctor and the Student Interfaces and the business rules that govern test opportunities	Software Project Manager
CSSC	Online Reporting System specifications	Lists the reporting settings for student and aggregate reports	Software Project Manager
Reporting	Reporting specifications	Details the reports, data elements to be included, calculation rules for each data element, special rules for merging and cleaning data, and other similar items	Reporting Lead
Reporting	Report mockups	Presents annotated graphic mockup of reports, providing the look and feel and identifying the critical elements of the visual appearance of the reports	Reporting Lead

will log all change requests into the Change Control Log and then assign a subject matter expert (SME) to analyze the impact of the change request on the scope/deliverables, schedule, budget, and overall project quality. The SME analyzes the request and documents the impact including the feasibility of making the change and any impacts and risks associated with the change. In some instances, it may be necessary to define the impact if the change is not made. The Program Manager will review the analysis and provide it to the key stakeholders, including the Department, to either authorize or reject the change. A change will not be implemented until the Department has signed off on the change in writing. Whether the change is approved or rejected, the Program Manager will update the Change Control Log to reflect the updated status. A sample Change Control Log can be found in Appendix K.

Changes are reflected in the appropriate communication documents through a carefully coordinated process. The Program Manager is responsible for communicating the changes to the document owner, who reviews the changes and amends the document. The document is then routed to each stakeholder who has subscribed to the document. Changes to the document are not final until they receive signoff from each stakeholder. The document owner is responsible for ensuring that the changes are accurately drafted, reviewed, and accepted by each stakeholder, including the Department. A change will not be implemented until the Department has signed off on the change in writing.

Issue Management

AIR understands that these are high-stakes online administrations and any issue that arises must be dealt with quickly and effectively. The Program Manager will maintain an issues log that will be updated regularly and reviewed at each weekly meeting.

Once an issue is identified, it will be reported to the Program Manager who will evaluate the issue with the project team. If the issue is considered valid, it will be added to the issues log with all pertinent information, and a priority will be assigned. This log will be reviewed during the weekly conference calls. However, if the issue is assigned a priority of medium or

high, the issue will be immediately shared with AIR management and the Department staff as needed, according to proper escalation protocol. Program staff will be assigned to determine the resolution. This information will be shared with the Department staff, but no action will be taken until approval is received from the Department to proceed.

The issues log will be managed by the Program Manager, and it will be available to all stakeholders via the document management system. Each issue will receive a unique number when entered into the log. The entry in the log will include a description of the issue, the date identified, the person who identified it, and the method used to report it. Each issue will be evaluated to measure the affected program team members, to define the impacted areas of the project and to be assigned a priority. Each issue entry will indicate the owner of the issue, the action steps to be taken, and the expected resolution date. Each issue must be approved by the Department before any action can be undertaken. Finally, the actual resolution date and status will be updated. Like most other project documentation, the issues log will be reviewed by the project team regularly to ensure that issues are being resolved. The document will be updated and communicated to all project stakeholders as updates are made.

A sample issues log can be found in Appendix I.

Risk Management

AIR understands the need to analyze and monitor risks in all our programs. It is critical that the risk management plan be vetted and complete as early in the project as possible.

AIR looks forward to working with the Department staff to complete and approve this process. In conjunction with the Department, an initial risk management plan defining all processes used in risk management will be developed and delivered to the Department within a mutually agreeable timeframe.

Because of the high stakes associated with this program, it is vital that schedules are monitored closely and that sufficient time is provided for reviews and production of materials. The risk log will be reviewed at each cycle kickoff meeting, as well as during weekly progress meetings throughout the life of the project.

A sample risk register format can be found in Appendix J.

Annual Program Review and Accounting Reports

AIR will provide two copies of the Annual Program Review each year via CDs/DVDs/jump drives inside plastic sleeves in loose-leaf binders. The Annual Program Review will include a record of major program accomplishments and successes as well as proposed changes and improvements. The review will address all aspects of program service, including details of meetings held with educators, milestones attained/deliverables completed for each project area, issues encountered, root cause analysis, corrective actions taken, and performance metrics reports as required by the Department.

In addition, AIR will provide electronic copies of the following:

- PDFs of the test answer books
- PDFs of all screenshots for computer-based test approved forms
- PDFs of all passage booklets, reference sheets, large print test books, one-item-per-page test books, large print reference sheets, large print response grid instruction sheets, and CBT work folders

- PDFs (untagged and tagged, if applicable) of all interpretive and ancillary products
- Native application files of all interpretive and ancillary products
- PDFs, or other appropriate file formats such as video, of all other products, including memoranda and report templates
- Missing materials and resolution reports
- Final Program Schedule reflecting planned vs. actual dates of task completion
- Weekly Management and Action Item reports
- File Layouts
- Specifications documents

Accounting Reports

The Accounting Reports will provide a summary of the Quarterly Accounting reports. The Accounting Reports will list expenditures by program task and level of effort as well as expenditures and balances of Reimbursable Funding Categories. See Section 7.7.9 for more information.

We look forward to working with the Department to adapt and merge our Program Management documentation tools and processes to fit the needs of the Department going forward.

7.7.7 Meetings Involving Florida Educators and Other Citizens

AIR has conducted thousands of meetings for Departments of Education over the years. We are committed to providing on-site meeting organization, support, and management for all meetings outlined in the ITN. Our project management staff will coordinate the flow of materials, offer on-site meeting assistance, address the Department staff's needs, and take care of all post-meeting procedures. In addition to our project management staff, AIR is supported by a full-service meeting planning staff dedicated to supporting the project team in meetings and exceeding the Department's and participants' needs.

Details on the content of the following specific meetings can be found in Section 7.3.4 of our proposal: Bias and Sensitivity Committee Reviews, Passage and Item Bias Meetings, Passage and Item Community Sensitivity Meetings, Passage and Item Content Review Committees, Data Review Committee, and Content Advisory Committee. Details on the content of Rangefinding, Technical Advisory Committee, and Standard Setting can be found in Sections 7.5.4.5, 7.6.0, and 7.6.3.4 respectively.

AIR understands that the Department will facilitate all meetings unless otherwise specified. The Department will designate Florida educators, Florida citizens, or consultants to participate in meetings, which AIR staff will attend, as required. Our project management staff, comprising the project manager, the team leaders for the program area, and an administrative assistant, will be responsible for arranging, organizing, attending, and paying the cost of bringing participants to specific meetings. Appropriate AIR staff will assist and participate in each meeting. We understand that for all meetings involving separate subject/grade groups, we will be required to provide the appropriate professional staff to take part in each of the separate subject/grade groups. AIR will be responsible for all expenses associated with our staff's travel and participation. All expenses incurred will be in accordance with the Department of Financial Services Guidelines for State Expenditures.

We will also arrange, organize, attend, and pay travel, lodging, and per diem costs required to bring participants together for all meetings outlined in Table 7.7.7 of the ITN. AIR understands and is fully prepared to meet the speci-

fications outlined in Table 7.7.7. regarding expected meeting durations, approximate number of attendees, and estimated costs for each meeting. In this section we provide more details on our meeting logistics, committee travel and reimbursements, and contractor staff travel and expenses.

Meeting Logistics

AIR will make all logistical arrangements and cover costs for each meeting outlined in Table 7.7.7 of the ITN. AIR has many years of experience providing high-quality, responsive, and flexible meeting planning services to large-scale assessment clients. Our meeting planning and coordination experts are qualified and prepared to provide first-class meeting services for Florida.

Well-organized, coordinated meetings, and associated administrative processes, combined with appropriate and comfortable meeting facilities, help promote successful assessment programs. Over the years, AIR has gained considerable experience coordinating all types of meetings for multiple assessment clients, establishing lasting relationships with meeting facilitators and their staff and ensuring a high level of customer service.

AIR's meeting coordinators work closely with other project team members to ensure that all administrative processes and meeting arrangements exceed client expectations. AIR's staff is skilled at negotiating contracts with hotels and meeting facilities to obtain optimal rates and ensuring that meeting costs are within project budgets. AIR provides full-service meeting administration services to clients as well, including overall organization and coordination for meeting participants; developing and distributing letters and e-mail communications to attendees; tracking participant registration; and processing invoices, travel vouchers, stipends (for eligible committees), and substitute teacher reimbursement forms to ensure proper payment. AIR's meeting coordination staff excels at providing exceptional customer service to meeting attendees.

AIR will provide the following logistical services for committee meetings:

Meeting Location—AIR understands that meetings held in Florida will typically be organized in a central Florida location, a hub city such as Jacksonville, or in Tallahassee. For both in-state and out-of-state locations, AIR will work with the Department to identify easily accessible and cost-effective locations for meetings (i.e., capacity to meet the logistical demands of large-scale, simultaneous, or multi-group meetings; proximity to the airport for committees attended by members who travel to the meeting from out of state). Meetings will be held at a hotel, conference center, or similar suitable location. Where possible, meetings will be scheduled concurrently and in the same venue to reduce costs. AIR will continue to seek meeting locations that offer a variety of nearby, cost-effective restaurant options.

Facilities—AIR will make all facility arrangements, including securing appropriate meeting rooms and supplying all technology, audiovisual equipment, web access, and supplies needed to conduct the meetings. AIR will also take measures to ensure that the meeting rooms are secure.

Meeting Planning Documentation—Prior to each meeting, AIR will provide information to the Department that outlines the parameters of the meeting, participants, logistical information, and the Department-required materials, resources, and other details. Upon the Department's approval, AIR will produce meeting schedules, agendas and participant lists for each meeting. At the conclusion of each meeting, a follow-up report containing meeting notes, review logs, action items, a summary of results, copies of committee member paper-

work, and any other requested information will be provided to the Department. These materials can be delivered in hardcopy or electronically, depending on the Department's preference.

Meeting Facilitation and Management—AIR's test development and/or technical staff (depending on the meeting), along with an AIR meeting planner/administrative assistant, will be present at meetings, as needed, to provide overall meeting management and support to the Department.

Signed Agreements—AIR requires signed security agreements from all committee meeting participants and retains the agreements for the duration of the contract. At the beginning of all meetings, each participant will be asked to sign a confidentiality (non-disclosure) letter specifying the confidentiality agreement and security regulations. The agreement will also outline ownership regulations. AIR will ensure that no confidential materials related to the project will be released without the Department's explicit approval. The original copies of these forms will be retained in secure storage, and copies will be made available to the Department upon request.

Secure Materials—Secure materials will never be left unattended. AIR staff will monitor the security of all testing-related materials throughout the entire process. AIR will continue to prepare secure materials on green paper for easy identification.

All materials sent to meetings are personally delivered, ensuring security. Should any materials require shipment, packages will be sent through a secured mailing process and have tracking documentation.

AIR will number each set of materials used during the meetings so that any missing material will be immediately noted when materials are checked in and out each meeting day.

When materials are not in use, they will be kept in a locked space. AIR staff is vigilant about maintaining security at these meetings. AIR will work with the Department to ensure that the Department's preferences and requirements for meetings are understood and met. All prices associated with meeting planning services and deliverables have been provided in the Cost Proposal.

Committee Travel, Communication, and Reimbursements

Travel Arrangements—AIR will secure hotel rooms for participants who travel specified distances to the meeting site and therefore meet eligibility criteria for sleeping rooms (i.e., travel more than 100 miles for a multiday meeting). When possible, AIR will secure sleeping rooms at hotels that offer complimentary Internet access and breakfast and/or evening receptions. AIR will reimburse participants for travel-related expenses, including airfare, car rental, hotel accommodations, and other relevant expenses, such as tolls, parking, cab fare, and vicinity mileage for personal vehicle use.

Communication with Participants—AIR understands that the Department will designate Florida educators, Florida citizens, or consultants from outside the state to participate in meetings as required. Based on participant lists provided by the Department, AIR will prepare and distribute meeting notifications, invitations, and logistical information to committee members. All communications with districts regarding meeting travel logistics will be reviewed and approved by the Department before sending to District personnel. AIR will also coordinate any follow-up communications to meeting participants after the meetings are concluded, as required by the Department.

Reimbursements—We understand that AIR will be responsible for paying travel, lodging, and per diem costs required to bring partici-

pants together for specific meetings as identified in the ITN.

Contractor Staff Travel and Expenses

AIR will be responsible for all expenses associated with our staff's travel and participation in all meetings. All expenses incurred will be in accordance with the Department of Financial Services Guidelines for State Expenditures.

7.7.8 Communication Between the Contractor and Districts

AIR will work with the Department to ensure that communications with the district are clear, consistent, and follow appropriate protocols. Our project staff members are sensitive to the fact that Departments of Education follow specific communication protocols unique to their programs when communicating with districts. All communication between Florida's districts, schools, and AIR will be directed through or receive prior approval from the Department. In addition, we will work closely with the Department to establish communication guidelines that specify the protocols for drafting, reviewing, and sending all communications. Instructions on the types of communications that should be directed to the District Coordinator of Assessment will be included, as well as protocols for communicating with special schools. These specifications will be reviewed and approved by the Department and will be used by all AIR project staff to guide all district communications.

AIR will also establish a dedicated customer support line for district and school personnel as required in Section 7.7.8 of the ITN. This toll-free customer support line will be used only for the purpose of

- clarifying meeting travel logistics;
- ordering additional test materials;
- correcting computer-based system issues; and
- reporting problems with the delivery or pickup of test materials

Below we provide more detail on our

- proposed methods for communicating with districts;
- proposed process for drafting and reviewing all communications with the Department before submission; and
- proposed plan for providing additional customer service support for district and school personnel.

Proposed Methods for Communicating with Districts

Complex assessment programs serving large numbers of districts and schools require extraordinary coordination in all aspects, especially communication with districts. Our work supporting Departments of Education in Oregon, Hawaii, Delaware, Utah, and Minnesota has helped us refine a number of effective communication mechanisms to efficiently convey a range of messages. For example, we have found that the portal home page is an effective mechanism for posting important announcements about PreID windows, upcoming webinars, or the availability of the secure browser for download. At the same time, information on the status of each online system is typically posted on a separate website so district and school personnel can quickly confirm whether systems are operable across the state or if they may be experiencing a local issue. AIR will use the specific mode of communication as required by the Department when communicating with the districts including e-mail, fax, or mail. In addition, we propose the following communication mechanisms for specific information:

1. Portal announcements
2. Status of online systems
3. E-mail blasts to the districts on a specific topic requiring immediate attention
4. Memos containing clarifying instructions
5. Memos accompanying shipments of score reports or test booklets

Portal Home Page

Our portal home page serves as a central location for district and school personnel to access (please see Exhibit 7.7.8-1, sample portal home page from the Hawaii portal). For this reason, the home page provides an optimal location to post important announcements regarding a number of topics including:

- date, time, and login information for training webinars;
- availability of online training courses and reminders on which personnel are required to take these courses;
- reminders to districts about the dates they can expect shipments of test booklets and score reports;
- opening dates for TIDE and the availability of the TIDE User Guide along with a reminder about the specific tasks that districts are required to perform in TIDE; and
- availability of the training test site for students and Test Administrators and instructions on how to access these sites.

The Department can, of course, use the portal home page for other information and announcements. All text for announcements will be reviewed and approved by the Department prior to release.

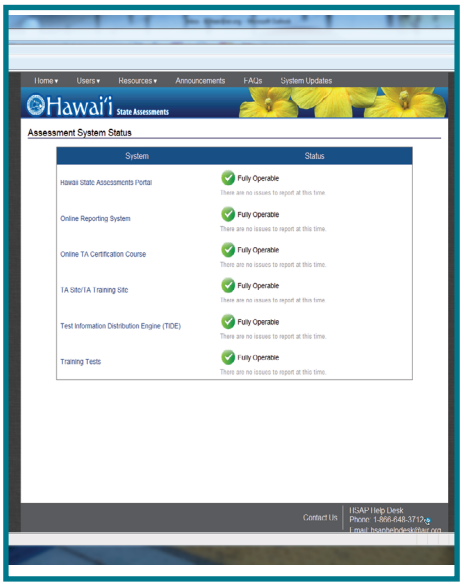
System Status Page

In addition to announcements housed on the portal home page, we also propose to create a separate status page to allow schools and districts to easily confirm whether online systems are operable or whether they may be experiencing a local issue. Please see Exhibit 7.7.8-2, a status page from Hawaii.

We will work with the Department to draft all text for the status page for each online system. All subsequent text changes and updates to the status page will require Department approval prior to being implemented.

Exhibit 7.7.8-1: Sample Portal Home Page

Exhibit 7.7.8-2: Sample Systems Status Page



E-mail Communications to Districts

With multiple responsibilities and assessments administered simultaneously, districts often need additional reminders to help them complete the tasks required during an administration. We have found that in addition to announcements posted on the portal home page, e-mail blasts directly to District Assessment Coordinators can be effective (please see sample e-mail to districts below). We understand that the Department may prefer alternative modes of communication with districts, including fax, memo, and regular mail, and are willing to use these mechanisms as required. As stated above, any communication to districts will be thoroughly vetted and approved by the Department before sent.

As we enter the final week of online testing, a few reminders:

- *All online tests must be completed in the online testing system by 5:00 p.m. on Friday, May 18.*
- *All student responses from accommodated test materials must be entered into the Data Entry Interface by 5:00 p.m.*

If you have any questions, please contact the AIR Help Desk at 1–877-xxx-xxxx.

Memos

In addition to the above communication mechanisms, we propose to draft memos that contain clarifying instructions or that accompany shipments of score reports or test booklets. Memos accompanying shipments typically summarize the contents of the shipment and include a link to view updates on the status of material orders or online reports, as well as the toll-free customer service number to address any questions. Memos containing clarifying instructions generally focus on a specific task and outline the steps required to complete that task (for example, how to access district passwords or request a new password if your password was lost). All district memos will follow the proposed review and approval process outlined below and will require Department approval prior to release.

Description of Process to Draft, Review, and Approve All District Communications

AIR's project teams are well versed in thoroughly vetting all communications with our clients prior to communicating with districts or schools. Our standard process for drafting all district and school communications, such as portal announcements, updates to the status page, memos, district e-mails, and instructions, include the following review steps:

- Senior program manager discusses the proposed communication with the Department and obtains the Department's preferred mode of communication and agreement on the general message
- Project team drafts the initial communication
- AIR editors review and edit the draft using the Department's style guidelines
- Project team sends the draft communication to the Department for review
- Project team implements the Department's revisions and sends to AIR editors for final edit check
- Project team sends final edited draft back to Department for approval
- Department approves communication to be sent to districts

We will work closely with the Department to add additional stages of Department review as required.

Dedicated Customer Support Line for Districts

AIR will follow the same process outlined in Section 7.4.10 to provide additional customer service and technical support to district coordinators of assessment. We describe our plan for customer support in Section 7.4.10. In that section, we commit to providing a dedicated toll-free line Monday through Friday from 7:00 a.m. to 8:30 p.m. for all district and school personnel.

In addition to the customer service provided in Section 7.4.10, we understand that districts will require a second dedicated customer service line to ask questions regarding the following topics:

- Clarifying meeting travel logistics
- Ordering additional test materials
- Correcting computer-based system issues
- Reporting problems with the delivery or pickup of test materials

In order to answer queries from district coordinators of assessment on the above topics, we will provide additional customer service Monday through Friday from 6:00 a.m. to 8:00 p.m. We can provide a second toll-free number for district assessment coordinators, or we can add a prompt (*press 2 if you are a district assessment coordinator*) on the main toll-free customer support number.

AIR will also provide web-based, searchable frequently asked questions (FAQs) on the portal to provide districts and schools with answers to common questions from the topics listed above.

7.7.9 Reimburseable Funding Categories

AIR is completely familiar with support for reimbursable services in our fixed-price statewide assessment projects. We have formal procedures that we will adapt to include all formal authorizations from the Department, along with appropriate follow-up documentation to ensure such services were completed to the Department's satisfaction.

1. Consultant services. AIR has procured similar services for Ohio, New Mexico, and other states for tasks such as independent research studies, TAC presentations, and specialized training.
2. Contingency services. On existing contracts, AIR is often asked to provide cost estimates for such activities as unexpected analyses.
3. Author's alterations and design control. We appreciate Florida's understanding of the cost impact of last-minute changes.
4. Provision for meetings with Florida educators
5. Provision for meetings with Department staff
6. Contractor staff positions. AIR currently supports multiple editors for Minnesota. We believe these contractor staff will find AIR's fringe benefits package most competitive.

The most important control associated with reimbursable funding is clearly defined purchase authority. AIR will work with the contracting officer immediately upon contract award to document who is authorized to expend these funds. With several of AIR's clients, different client individuals have different authority based on level of cost or work assignment. We will ensure this document is kept up to date.

To support Department decision-making, AIR will present cost estimates whenever possible. For example, if the Department requests an additional analysis or a preferential blueline change, AIR will provide a cost estimate to enable the Department to do a cost-benefit analysis.

We can easily capture and report these costs on the required accounting reports. Within AIR's cost accounting system, we will establish separate project codes for each of these six areas and open a new subcode for each authorized assignment. AIR's core financial system is Deltek's Costpoint, which is the industry-leading ERP software designed specifically to meet the business needs of sophisticated project-driven organizations. It also holds the largest market share in financial software for government contractors. With Costpoint, AIR can track, manage, and report on every aspect of a project, including budgets, schedules, expenses, purchasing, revenue recognition, business performance, regulatory compliance, and more. Because AIR is a major federal government contractor, our accounting system is routinely audited by the federal government.

7.7.10 Final Delivery of Materials

Introduction

The successful transition of a testing program entails transferring all required data, products, knowledge, and other state-owned assets. The transfer must

- be complete and correct;
- avoid disruption of services or support during the transition period; and
- ensure that the tests remain accurately equated over time.

AIR's management process, described in Section 7.7.0, relies on detailed specification documents for virtually every element of the program. We use these documents to ensure clear and uncomplicated communication of specifications within our organization and between our organization and the Florida Department of Education. These same documents will clearly communicate the specifications and requirements to the next contractor working with the Department on this program.

Below, we discuss our experience and processes for ensuring a smooth transition from this

contract to the next, should AIR be selected as the Contractor.

Transition Experience

During the past 7 years, AIR has successfully transitioned from other contractors over a dozen separate testing programs in Ohio, Oregon, Hawaii, South Carolina, New Mexico, Delaware, Minnesota, and Utah. When the time comes to transition this program to another contractor, AIR will support the Department as we would hope to be supported when programs are transitioned to us.

Our most recent experiences demanded aggressive transition timelines, a massive item and item bank transition, and the transition of technical specifications, reporting specifications, and other documentation details to ensure that a program could run uninterrupted and consistently after the change in contractors. In the course of each implementation, we have had the opportunity to establish best practices for effective transitions from one contractor to the next.

Ohio

AIR transitioned the OGT program from Measurement Incorporated in 2006–07. In this case, AIR worked with the Ohio Department of Education to develop a transition matrix, identifying each piece of information, data, or content, along with its preferred source and format. The matrix facilitated a smooth transition and became the focal point of a series of transition meetings. The success of that transition model has made it the standard approach recommended by AIR, and we have used it successfully in other programs, as noted below.

Hawaii

When AIR took over Hawaii's entire state assessment program, we were able to obtain much of the needed data and documentation directly from Hawaii Department of Education (HIDOE) staff and files rather than from the prior contractor. This information had been reviewed and verified by HIDOE as part of its processes. In other cases, we had to rely on information gathered from the outgoing contractor. This information was not always shared promptly, and we discovered many inconsistencies, inaccuracies, and other problems in the data. For example, test item identifiers were sometimes repeated with different items, or multiple, different versions of items appeared on different paper forms.

To address this issue, we established a policy of independent verification of every item and the linkages among them. For example, our technical team replicated several years of calibration and linkage information to ensure that we had the correct data and items. Bookmaps were compared with physical test booklets and then compared to items extracted from electronic Quark files to ensure that they were accurately linked.

In some cases, neither HIDOE nor the prior contractor had the material we needed. For example, we did not receive an electronic item bank. We extracted the items directly from the Quark files of all prior administrations. We developed software to extract the item text, formats, graphics, and location from the books and loaded them into AIR's Item Tracking System (ITS). Additionally, we discovered that the item identifiers embedded in the file did not always match the test bookmaps (Excel files). Resolving this discrepancy required an extensive quality control effort to prepare an accurate item bank to begin our work. We also discovered that the previous contractor did not maintain a list of previously released items or items that were rejected at data review. Without this information, we were at risk of including one of these items on a subsequent test. This lack of data required us to expand

our transition list to include all prior practice tests, parent information booklets, and other documents that contained released items. Because of these and other issues, the transition process lasted longer than HIDOE or the previous contractor anticipated and required flexibility from all involved.

Utah

More recently, we had the opportunity to again transition a statewide assessment program from another contractor to AIR and to learn valuable lessons in the process. As we entered into our contract with the Utah State Office of Education (USOE), we provided a transition specification document to request key information needed for a successful transition of their testing program. USOE was only able to provide a small number of the requested materials. AIR then initiated a process to develop documentation, based on our many discussions with USOE staff, to obtain the information required and to create a full documentation library for USOE to use moving forward.

The Utah contract included the transfer of their item pool from their existing vendor to AIR. The contract called for the items to be provided in standard QTI format. However, the prior vendor was not able to provide this format. AIR worked with USOE and their prior vendor to define a workable format that the prior vendor could provide. The AIR technology team developed scripts to successfully import the items into the new item bank.

These examples underscore the need for a meeting of the minds between the state department of education, the outgoing contractor and the new contractor on such issues as the format of the information to be delivered and the availability of required materials prior to implementation.

Requirements for Successful Transition

We have experienced both successes and challenges in our transitions over the years, and we have learned that a successful transition has four core requirements:

Identification: The first step in developing a transition plan is to clearly identify all requisite transition information, as well as the data and format in which the data will be delivered.

Planning: Highly detailed plans chronicling specific delivery deadlines for transferred information facilitate a smooth transition.

Delivery: Once critical transition elements are identified and delivery timelines are established, the actual information transfer must be monitored to ensure that all information delivered is both accurate and timely.

Quality Control: To ensure successful completion, the transitioning contractor must support the new contractor in replicating work and run analyses to ensure that data and trends are accurate.

Successful transition can be facilitated through an ongoing transfer of program documents, data, and content from the contractor to the Department. This will ensure that the Department has access to, and control of, the necessary products for your system.

The specific documents, data, and content to be transferred will be detailed in a specifications document described later in this section and may include such materials and products as

- test books;
- answer documents;
- final electronic source files of interpretive products;
- software source code; and
- ancillary materials.

In addition, we recognize that integrating the Department's data and content with the new contractor's systems will require support from the outgoing contractor. We have been on both sides of assessment program transitions, and we understand the factors that can contribute to a successful transition. Putting to work the lessons we have learned, we propose a plan that follows these five steps:

1. An initial meeting is convened between the Department and AIR to identify the critical information that needs to be transferred and to discuss the quality assurance plans that will ensure accurate transfer.
2. AIR completes a draft of the transition specification document, which includes details about the format of the information to be delivered and the delivery schedule.
3. The Department, the new contractor, and AIR meet to review the transition specification document, refine it as needed and negotiate any changes.
4. AIR completes the final transition specification document by specifying the exact approach to be taken to incorporate the transferred information into our workflow and systems and to refine the quality assurance plan associated with each item.
5. AIR implements the plan as outlined in the Department-approved transition specification document.

Below, we provide more details about key transition meetings that will help facilitate the process.

Transition Meetings

As noted above, we propose beginning with a discussion of the information to be transferred, the preferred format, the quality assurance plan, and the schedule for implementation, all of which will be captured in the transition specifications.

It is, of course, necessary to negotiate the specifics of the plan: What information is already available to the new contractor? In what format does the new contractor need the information? When does the new contractor need each piece of information? In what format is it possible for us to deliver on schedule? These questions will be addressed in a series of meetings:

Initial Planning Meeting: A preliminary meeting to draft a transition specification document that identifies all relevant data, test items, testing information, and other materials necessary for a successful transition.

Contractor Meeting: A follow-up meeting with the Department and the new contractor. During this meeting, both the project leadership and technical/operational staff of the new contractor will work with AIR and the Department to define information format and delivery schedules and to finalize the transition specification document.

Transition Meetings: Smaller meetings specific to relevant functional areas. Staff from AIR, the Department, and the new contractor will monitor transition timelines and delivery compliance as defined in the transition specification document.

We recommend that the initial meeting include all the technical Department staff members that have specific knowledge of the data, items, information, and other materials needed to transition the program. We propose a subsequent meeting to include the new contractor, whose representatives will include both the project leadership and the technical/operational staff. During this meeting, the transition specifications will be finalized. Based on our experience, we recommend that these meetings be convened face-to-face.

Smaller working meetings will be necessary between the new contractor's functional team

leads, the technical/operational staff of AIR and the Department. Project leadership may choose to join. In previous transitions, these smaller meetings have been convened as conference calls on a set schedule (e.g., biweekly, 1-hour calls for 3 to 4 months). We will update the status of each item on the transition specifications before each call.

Replication

Replication studies are critical to ensuring that the key transition goals are achieved, and AIR recognizes that small psychometric errors can have vast consequences, such as scores that are based on inaccurately linked data or inaccurate conversion tables.

We recommend that the receiving contractor replicate statistical analyses to ensure that the specifications have been interpreted correctly. We have included time in our budget to advise the subsequent contractor on the interpretation of statistical specification documents, if the Department chooses to have a subsequent contractor undertake replication activities.

For these reasons, we recommend that a new contractor replicate

- 2 years of classical item statistics;
- 2 years of IRT calibrations;
- 2 years of linkages; and
- 2 years of conversion tables.

These replications will help ensure that the item parameters imported to the new contractor's item bank represent the appropriate versions and that they have been appropriately linked. Even the smallest discrepancies will raise a red flag, and we commit to advising the new contractor in their investigation to determine the cause of any differences.

Transfer Materials and Knowledge

During the transition to a new contractor, we propose to use our transition specification document to guide the process. We use this document to keep track of progress and plan for contingencies around what may or may not be available. Our preliminary plan is organized according to our functional teams, including test development, psychometrics and statistics, operations, alternate assessment, score reporting, and websites. The transition specification document captures the information outlined in Exhibit 7.7.10-1.

We note that the final transition specification document will include quality assurance steps for every element to ensure that the information delivered is correct. This may include identifying sources or formats for information that may be less convenient for the new contractor to use but are more reliable and accurate.

For each area of activity, we complete the full transition specification for each detailed item and track it throughout the transition process. These specifications are necessarily quite detailed. For example, some items that might appear under paper score reports are

- scoring and reporting processing rules;
- statistical codes;
- technical specification for statistical calculations;
- input data layouts;
- reporting static content;
- reporting variable content;
- training support materials and documents; printing specifications; and
- focus group/research plans and results.

Exhibit 7.7.10-1: Transition Specification Document

Element	Description
Item Number	A number assigned to each element for inventory purposes
Team	The subject matter team that ultimately generates the material (e.g., psychometric/technical, reporting, scoring, customer service)
Item/Material	The data, knowledge, or other information required
Description	Detailed information about the item/material
Origination Entity/Person	The name of the person or entity responsible for ensuring the delivery
Reference or Source	A source of the information known to be accurate
Preferred Format	The new contractor's preferred format in which to receive the information
Best Available Format	The format in which we will actually deliver the information
Backup Format	An alternate format in which the data are also available in case a backup is necessary and where the best available format differs from the preferred format
Quality Control Plan	Where possible, the plan for ensuring the accuracy of the information
Delivery Date	The agreed-on delivery date
Actual Delivery Date	The actual delivery date
Provided By	The name of the person or entity at AIR who delivered the material
Receiving Entity/Person	The name of the person or entity at the new contractor who received the material
Completion Date	The date that the full transition of the material was complete
Status	1 = complete; 0 = incomplete

Conclusion

Within 30 days following acceptance by the Department of the final program report, AIR will transfer the information enumerated in the transition specifications document to the Department on an ongoing basis and work with the incoming vendor to provide the data in a format that may be integrated with its systems. This will ensure transition materials support the reproduction of key testing program elements.

Further, as required by the Department and upon its authorization, AIR will destroy all data files remaining in our possession once all handoffs are made to the next contractor, and provide written verification of destruction to the Department.

If we are the selected contractor, we will commit to supporting the next vendor's transition as we would hope to be supported as an incoming contractor.

Test Date: 2012–2013

FAMILY Report

Reading & Mathematics
Assessment Results

DRAFT

Dear Doe Family:

The Hawai'i Department of Education is pleased to send you this report about Jane's performance on the Online Hawai'i State Reading and Mathematics Assessments. The Reading and Mathematics Assessments are designed to test students on the Hawai'i Content and Performance Standards (HCPS III) learned in the previous school year. The standards describe what students should know and be able to do in reading and mathematics.

Students are permitted to take each assessment up to three times during the school year. This report shows Jane's best performance on the assessments for each subject, which counts as her official score for that subject.

In addition to showing how well Jane did on the assessments, this report compares her scores with those of other students in her school, her complex area, and the state. It explains the different areas of the Reading and Mathematics Assessments. Also, the report shows whether Jane reached proficiency in these areas and suggests how you can help her improve her reading and mathematics skills.

The report also includes Jane's Lexile® measure that indicates her current reading ability based on the Reading Assessment. The Lexile® measure can help you select appropriate reading materials for your child to read at home and also monitor her progress as she works to become a better reader over time. More information about Lexile® measure can be found on page 4 of this report.

For additional information, I encourage you to talk to Jane's teacher about this report, what it means, and how you can help.

Very truly yours,

Kathryn S. Matayoshi
Superintendent of Education

What is in this report?

- Jane's scores on the Reading and Mathematics Assessments
- Jane's Lexile® measure
- How Jane's scores compare
- The areas that make up the Reading and Mathematics Assessments
- Whether Jane reached proficiency in the different areas of each subject
- How you can help Jane improve her Reading and Mathematics skills

For more information about this assessment, go to www.alohahsap.org

Grade 3
2012–2013

Hawai'i Department of Education

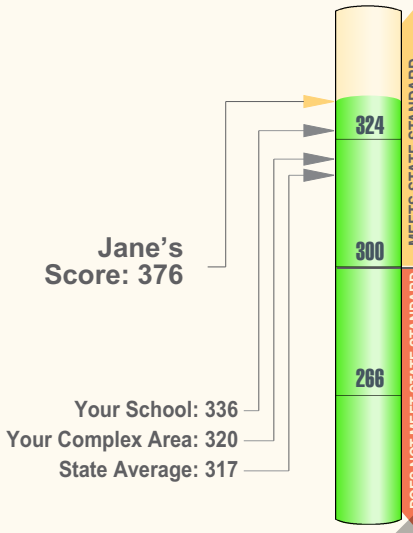
Jane's Reading Score

376

How does this compare?

Jane's Reading score is 376. This score is higher than the average score of third graders in her school, higher than that of third graders in her complex area, and higher than that of third graders statewide.

A student's test score can vary if the test is taken several times. If your child was tested again, it is likely that Jane would receive a score between 358 and 394.



Exceeds Proficiency - Students can determine the meaning of words by using word parts, explain the purpose of literary and informational texts based on how they are organized, and compare and contrast parts of texts.

Meets Proficiency - Students can identify the meaning of difficult words and main ideas in texts and can describe how different texts are organized.

Approaches Proficiency - Students can recognize the meaning of new words, make predictions about events and characters in texts, and give opinions about stories.

Well Below Proficiency - Students at this level demonstrate skills and understanding of Reading below the performance needed to reach the Approaches Proficiency level.

Using a home or library computer, go to www.alohahsap.org to see a complete listing of skills for each level.

Has Jane Reached Proficiency in the Different Areas of Reading?

		Next Steps
Conventions and Skills *Use knowledge of the conventions of language and text to create meaning for different literary and informational texts for several purposes.*	**Near** The test does not always provide enough information to tell if a student has reached the Meets Proficiency mark for this area of Reading. Students may recognize sounds and letters, read third-grade-level vocabulary, and find the meaning of new words. They may be able to read different types of grade 3 texts.	For example, read out loud to your child, especially books that are too difficult for her to read on her own. Discuss new vocabulary by asking what the words mean (e.g., "What is a dog doing if it 'snarls'?") and showing that words have different parts (e.g., singing = sing + ing).
Reading Comprehension *Use reading strategies (like understanding how texts are organized; making predictions; finding main ideas, problems, or solutions) to create meaning from different texts.*	**Yes** The score is at or above the Meets Proficiency range for this area of Reading. Students in this range understand most of what they read. Students understand main ideas and events and can make predictions. They can also identify problems and solutions.	For example, have your child read different types of texts, like chapter books, nonfiction, and magazine articles. Encourage her to guess the end of the story. Ask your child why some events might take place and what the author's purpose or goal might be.
Literary Response and Analysis *Respond to literary texts from many points of view: personal (like giving opinions), interpretive (like explaining main ideas or events), and critical (like explaining the difference between figurative and literal language).*	**Yes** The score is at or above the Meets Proficiency range for this area of Reading. Students in this range understand literary texts by giving opinions, figuring out main ideas and events, and understanding that language can be literal or figurative (for example, "he was a bear" means that the man was very big and grumpy). They understand the author's purpose for using figurative language.	For example, have your child read different types of literary texts, like poems, chapter books, and short stories. While your child reads, ask her opinion of the text (e.g., Why did a character act a certain way?). After reading, ask your child to analyze the story (why the events happened). Help your child pick out examples of similes (e.g., "Rex is like a bear") and idioms (e.g., "I will take a rain check on the offer").

DRAFT

Hawai'i Department of Education

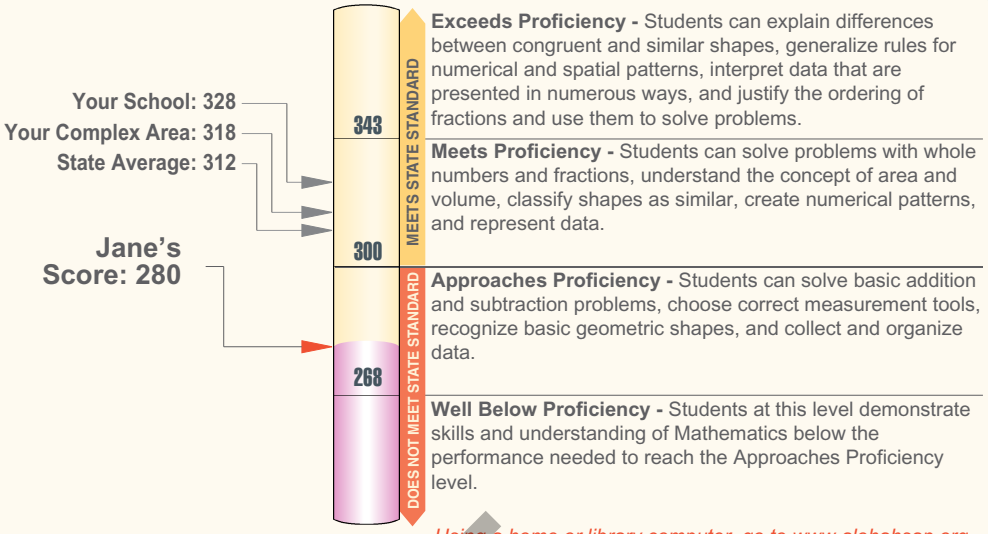
Jane's Mathematics Score

280

How does this compare?

Jane's Mathematics score is 280. This score is lower than the average score of third graders in her school, lower than that of third graders in her complex area, and lower than that of third graders statewide.

A student's test score can vary if the test is taken several times. If your child was tested again, it is likely that Jane would receive a score between 268 and 292.



Exceeds Proficiency - Students can explain differences between congruent and similar shapes, generalize rules for numerical and spatial patterns, interpret data that are presented in numerous ways, and justify the ordering of fractions and use them to solve problems.

Meets Proficiency - Students can solve problems with whole numbers and fractions, understand the concept of area and volume, classify shapes as similar, create numerical patterns, and represent data.

Approaches Proficiency - Students can solve basic addition and subtraction problems, choose correct measurement tools, recognize basic geometric shapes, and collect and organize data.

Well Below Proficiency - Students at this level demonstrate skills and understanding of Mathematics below the performance needed to reach the Approaches Proficiency level.

Using a home or library computer, go to www.alohahsap.org to see a complete listing of skills for each level.

Has Jane Reached Proficiency in the Different Areas of Mathematics?

		Next Steps
Numbers and Operations *Understand numbers, ways of representing numbers, and relationships among numbers and number systems; understand the meaning of operations and how they relate to each other; use computational tools (like calculators) and strategies well; and use estimation when needed.*	**No** The score is below the Meets Proficiency range for this area of Mathematics. Students may be able to add and subtract 1-digit numbers but may have trouble adding and subtracting 2- and 3-digit numbers, may understand place value (for example, 24 is 2 tens and 4 ones), and may be able to recognize number sentences that have the same value.	For example, help your child add and subtract money. Talk about how a 1-dollar bill is 4 quarters, 1 quarter is 2 dimes and 1 nickel, and 1 quarter is $^1/_4$ of a dollar.
Measurement *Understand attributes, units, and systems of units in measurement (e.g., metric system) and develop and use techniques, tools, and formulas for measuring.*	**Near** The test does not always provide enough information to tell if a student has reached the Meets Proficiency mark for this area of Mathematics. Students may select and use standard tools to measure length, capacity, and weight with standard and metric units; be able to find the elapsed time between two events; and understand the concepts of area and volume.	For example, work with your child to estimate how many pictures are needed to cover the refrigerator door. Work with her to figure out how many cups of water are needed to fill a pitcher.
Geometry and Spatial Sense *Analyze properties of objects and relationships among the properties, use transformation and symmetry to analyze mathematical situations, use different representational systems including coordinate geometry, and use visualizations and spatial reasoning to solve problems.*	**No** The score is below the Meets Proficiency range for this area of Mathematics. Students may have difficulty recognizing and remembering some basic properties of shapes (e.g., triangles have 3 sides), knowing the differences between congruent and similar shapes (e.g., two squares are similar if one is a larger version of the other), and recognizing transformations (e.g., flips, turns) of shapes.	For example, have your child draw different triangles. Discuss why they are different (e.g., a right triangle has a 90-degree angle). Turn the paper clockwise a little and discuss how a triangle's size and shape stay the same, even after the turn.
Patterns, Functions, and Algebra *Understand different types of patterns and functional relationships and use symbolic forms to represent, model, and analyze mathematical situations.*	**No** The score is below the Meets Proficiency range for this area of Mathematics. Students may not be able to recognize numerical patterns (like 1, 5, 9, ...) or identify situations involving change (like how the height of a plant changes over time) and may have difficulty recognizing the model that represents an expression (like a picture that represents 1 + 3 = 4).	For example, play a game with your child by saying, "2, 5, 8, 11." Ask, "What is the next number?" Help her describe the pattern (adding 3 to each number).
Data Analysis, Statistics, and Probability *Ask questions and collect, organize, and represent data to answer questions; interpret data through exploratory data analysis; make and evaluate inferences, predictions, and arguments that are based on data; and understand and apply basic notions of chance and probability.*	**Near** The test does not always provide enough information to tell if a student has reached the Meets Proficiency mark for this area of Mathematics. Students may be able to organize and show data in more than one way, answer questions about the data set, and predict how likely it is that an event will take place (e.g., if a bag contains the numbers 1, 3, and 5, pulling a 2 is not likely).	For example, have your child put 10 red marbles, 8 blue marbles, and 1 green marble in a bag. Ask her how likely it is to pull a green marble from the bag. Discuss why it is unlikely that she will pull a green marble.

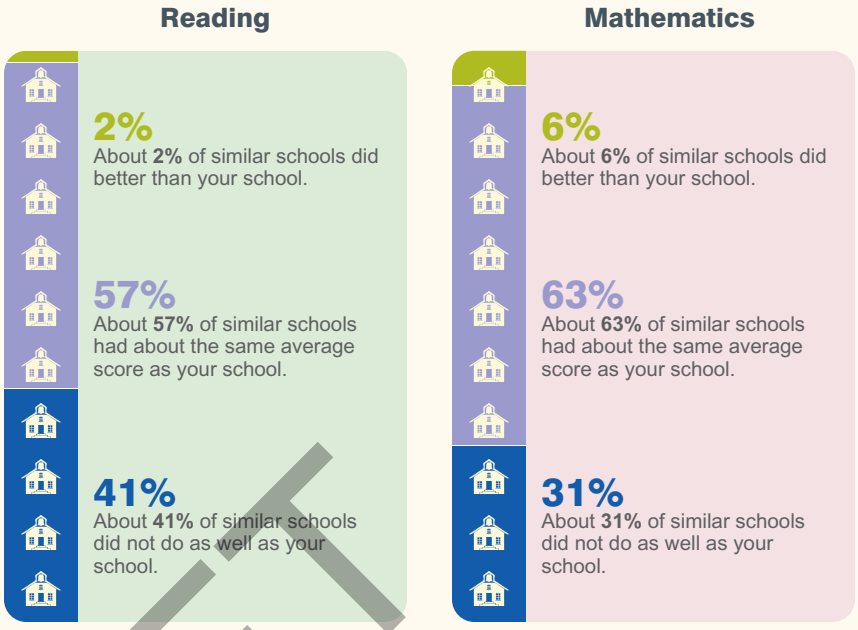
DRAFT

Similar Schools

This chart shows how third-grade students in Jane's school did compared with third-grade students in other schools when tested on concepts and skills that were taught to these third-grade students last year. School similarity is assessed by three criteria: percentage of (1) disadvantaged students, (2) English language learners, and (3) students with disabilities.

The schools that were compared with your school were chosen because their third-grade students had backgrounds most similar to third-grade students in your school. Aloha Elementary School teaches many disadvantaged students and many students with disabilities.

Students come from many different environments. These differences do not necessarily affect student performance. Many issues contribute to student performance, such as administration and oversight, curriculum and content, teaching and testing, professional development, instructional materials, parent and community support, and funding. You may want to contact your parent community networking coordinator to inquire about parent workshops that support the school's ongoing effort to improve student performance.



DRAFT

Reading Lexile® Measure

The Lexile Framework for Reading is a scientific approach to measuring readers and reading materials. A key component of the Lexile Framework is a number called the Lexile measure. A Lexile measure is a standard score that matches a student's reading ability with the difficulty of textual material. A Lexile can be interpreted as the level of text that a student can read with 75 percent comprehension. Experts have identified 75 percent comprehension as the level at which students can read with a certain amount of comfort while still being challenged.

Jane's Lexile® Measure

985L

Both a Lexile text measure and a Lexile reader measure are indicated using a simple number followed by an "L" (e.g., 850L) and are placed on the Lexile scale. The Lexile scale ranges from below 200L for beginner-level readers and text to above 1700L for advanced-level readers and text. A reader's recommended Lexile range is 50L above and 100L below his or her Lexile measure. This is the range between the easiest kind of reading materials for a student and the most difficult level at which he or she should be able to read.

The Online Hawai'i State Reading Assessment is linked to the Lexile Framework to provide educators and parents with an additional indicator of a student's reading ability. A student must take the Reading Assessment and receive a score in order to have a Lexile measure. Because the Lexile measure is a measure of textual difficulty, it does not take into account age appropriateness, student interest, or the content of the text.

For more information on interpreting Lexile® measure, please go to www.alohahsap.org.

Prepared for

The Family of Jane Smith

Ohio Department of Education

Grade 5 Reading, Math and Science Achievement Assessments

Dear Family,

In May, Jane took the Grade 5 Reading, Math and Science achievement assessments. These tests measure how much your student has learned at the end of the school year in relation to what is expected in the Ohio Academic Content Standards.

This report explains what Jane's test scores for spring 2013 mean. The report also includes ideas for ways that you can help her improve. I urge you to talk to Jane's teacher about the report and what can help keep Jane's learning on track.

Next school year, Ohio will move from the 10-year-old Ohio Academic Content Standards to **Ohio's New Learning Standards.** The new standards will call for your child to learn more in class than the old standards did. But the Ohio Achievement Assessments next year will be based on a combination of the old and new standards.

I also want you to know that there will be **new State and Local Report Cards. The Local Report Card grades your school district and school on how well they are doing in educating their students.** The new 2013 Local Report Cards are parent and student friendly and show grades from A-F on nine measures of student progress in learning. Ask your principal to explain the new Report Card for your school.

We wish Jane much success in her learning. Thank you for all you do to support her in school.

Sincerely,

Richard A. Ross

Dr. Richard A. Ross
Superintendent of Public Instruction

DRAFT

Quick Facts About Your Child and State Achievement Assessments

Q. Why does my child take achievement assessments?

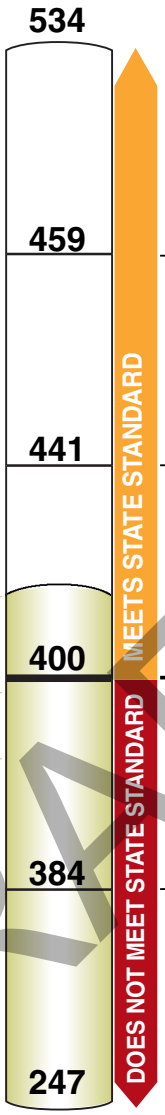
The Reading, Math, and Science Achievement Assessments help ensure that all students have learned the level of reading, math, and science expected of Ohio students at the end of the fifth grade.

Q. What happens if my child does not pass the Grade 5 Achievement Assessments?

These test results are one of the factors, but not the sole factor, that teachers use to evaluate a child's readiness to move to the next grade. Classroom teachers determine whether your child should move to Grade 6 by considering her class work and school attendance.

If your child does not score in the proficient or above levels, this is a sign that she is having trouble learning the skills and knowledge expected of fifth-grade students and may need additional help. This report includes suggested activities to help your child practice specific skills. Your child's teacher may be able to recommend additional ways your child can improve her achievement.

Reading Achievement Results



Advanced - Students go beyond simply understanding what they read and can make good judgments about the author's use of fact versus opinion.

Accelerated - Students understand what they read (e.g., plays, biographies, newspapers) and can summarize stated and unstated themes.

Proficient - Students understand what they read. They try to explain how an author's choice of words creates the story's mood and describes the story's setting.

Basic - Students understand some of what they read. They use strategies (e.g., authors' definitions and examples) to learn the meaning of new words.

Limited - Students may struggle with simple reading tasks (e.g., plays, biographies, newspapers).

Jane's score is 416.

She has performed at the proficient level and meets standards for Grade 5 Reading.

State Average Score: 416

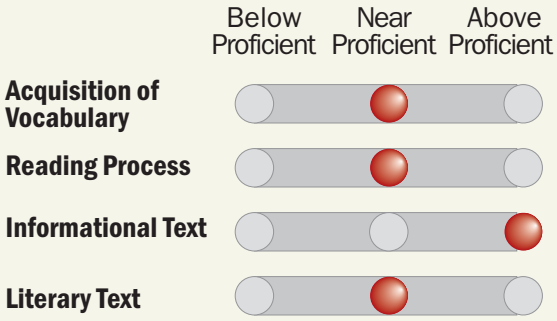
District Average Score: 399

School Average Score: 394

DRAFT

Different versions of the test are used each time the test is given. The scores in this report are used to compare performance from year to year. Scores in different subjects cannot be compared.

Has Jane reached proficient in the different areas of Reading?



This chart shows you how well Jane performed in each standard. She is near proficient in Acquisition of Vocabulary, near proficient in Reading Process, above proficient in Informational Text, and near proficient in Literary Text.

Note: There is some uncertainty in all test scores. Please see the interpretive guide for more information.

What Are Your Child's Strengths and Weaknesses in Reading?

See the released test questions from earlier years' achievement assessments at

www.success.ode.state.oh.us

Acquisition of Vocabulary

Jane Scored Near Proficient

Students use clues in the text, knowledge of word parts (e.g., *underneath*) and knowledge of where words come from (e.g., *autograph; graph* means *to write* in Greek) to learn new words. They understand figurative words (e.g., *the bus crawled through the traffic*).

WHAT THESE RESULTS MEAN

Your child is learning to use word parts (e.g., *eraser*) and clues in the texts to learn the meaning of new words. She understands figurative language (e.g., *the saw bit into the wood*). Your child can also abbreviate words (e.g., *St.* for *Street*; *Ave.* for *Avenue*).

NEXT STEPS

Have your child hunt for words with a specific part, such as prefixes (e.g., *un-*, *unhappy*; *pre-*, *preview*) and suffixes (e.g., *-ing*, *writing*; *-less*, *careless*). Choose other word parts and do the searches together.

Reading Process

Jane Scored Near Proficient

Students make and support predictions about what they read, and they summarize information. They can check their understanding and read in different ways (e.g., skimming, re-reading). They can use outlines to understand what they read.

WHAT THESE RESULTS MEAN

Your child is learning to gather ideas from different places in texts (e.g., dramas, biographies, newspapers). She uses new vocabulary and an understanding of the story's events to tell what will happen next in the story.

NEXT STEPS

Have your child read and retell part of a book for you. Have your child explain how the characters feel in the story or the reasons certain events took place in the story. Ask her to use details from the story for support.

Informational Text

Jane Scored Above Proficient

Students use text features (e.g., subheadings) to locate important information. Students compare information from different sources, summarize main ideas, and distinguish between important and unimportant details.

WHAT THESE RESULTS MEAN

Your child is able to pull out complex new information from what she reads. She understands how the author organizes ideas (e.g., as they happen, in question-answer format). This helps her understand the author's message.

NEXT STEPS

Have your child preview difficult informational texts, such as articles in magazines or newspapers. Have your child read a text that includes a chart and explain the relationship between the chart and the article.

Literary Text

Jane Scored Near Proficient

Students identify how the main events of a story affect what happens later in the story. They analyze setting, character and theme and how they affect each other. They explain how authors use figurative words (e.g., metaphors, similes) to create mood.

WHAT THESE RESULTS MEAN

Your child is learning to explain how different elements of a story (e.g., setting, character, theme) influence the story as a whole. She is learning to identify stated and unstated themes.

NEXT STEPS

Read the same story your child is reading and ask her to describe how the literary elements (e.g., action, character, plot, setting) influence each other. How does the setting affect the plot? How do characters affect one another? What is the theme?

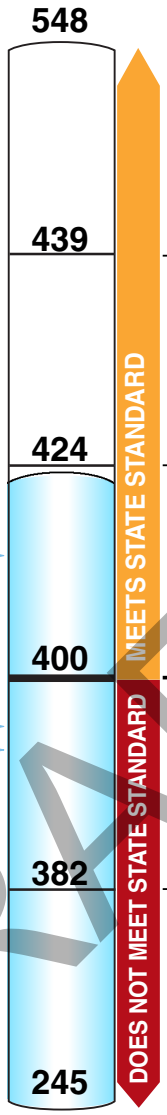
DRAFT

Spring 2013 012345.128

Math Achievement Results

Jane's score is 422.

She has performed at the proficient level and meets standards for Grade 5 Math.



Advanced - Students can solve new, complex problems (e.g., find the area of an irregular shape). They explain their reasoning using math terms (e.g., *probability*) and notation.

Accelerated - Students combine math ideas to solve problems (e.g., use multiplication to find area). They explain their reasoning (e.g., use terms and graphs to describe data).

Proficient - Students can solve common problems with fractions, percents and tools (e.g., protractor). They estimate solutions and use informal reasoning skills.

Basic - Students can remember math terms (e.g., *mean*) and concepts (e.g., using variables). They carry out routine procedures, such as finding areas and reading graphs.

Limited - Students struggle with math terms (e.g., *ray*) or concepts. They have trouble adding decimals and negative numbers and using words to describe number patterns.

State Average Score: 414

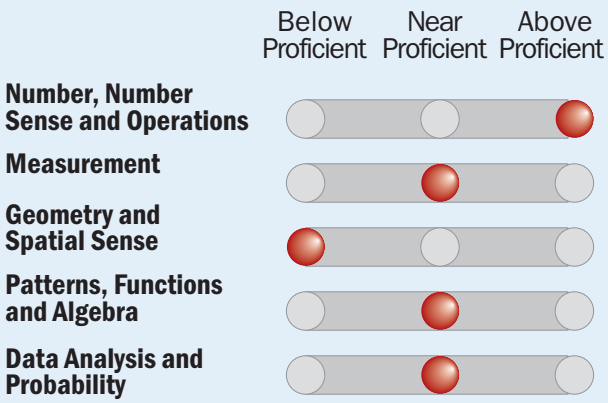
School Average Score: 396

District Average Score: 394

DRAFT

Different versions of the test are used each time the test is given. The scores in this report are used to compare performance from year to year. Scores in different subjects cannot be compared.

Has Jane reached proficient in the different areas of Math?



This chart shows you how well Jane performed in each standard. She is above proficient in Number, Number Sense, and Operations, near proficient in Measurement, below proficient in Geometry and Spatial Sense, near proficient in Patterns, Functions and Algebra, and near proficient in Data Analysis & Probability.

Note: There is some uncertainty in all test scores. Please see the interpretive guide for more information.

See the released test questions from earlier years' achievement assessments at www.success.ode.state.oh.us

What Are Your Child's Strengths and Weaknesses in Math?

Number, Number Sense and Operations

Students add and subtract fractions and decimals; show numbers in different ways (e.g., $1 = {}^{2}/_{2} = 1.0 = 100\%$); use rules of operations (+, -, ×, /); and understand ratios (1 to 2 = ${}^{1}/_{2}$), negative numbers and perfect squares (e.g., $81 = 9 \times 9$). They solve problems in many ways.

Jane Scored Above Proficient

WHAT THESE RESULTS MEAN

Your child can add, subtract and round fractions, decimals and percents. She can create and use equivalent forms of fractions (e.g., ${}^{2}/_{6} = {}^{1}/_{3}$), decimals (e.g., ${}^{1}/_{2} = 0.5$) and percents (e.g., ${}^{3}/_{4} = 0.75 = 75\%$). She can make estimates and determine their reasonableness.

NEXT STEPS

Have your child find examples of ratios around the house (e.g., 5 blue plates to 9 total plates). Help her use ratios to solve related problems such as, "The ratio of apples to bananas is 3 to 2. There are 15 apples. How many bananas are there?"

Measurement

Students draw and measure angles. They develop formulas for finding perimeter, area and volume; describe the difference between surface area and volume; and make conversions among measurement units (e.g., inches to feet).

Jane Scored Near Proficient

WHAT THESE RESULTS MEAN

Your child can estimate, measure and draw angles and make conversions between units (e.g., feet to inches). She can find perimeter, area and volume and the length of paths on a grid.

NEXT STEPS

When measuring length, capacity, weight, or time, give your child the measure in one unit and ask her to give you the measure in a different unit. For example, ask her to give you her height in feet and then in inches.

Geometry and Spatial Sense

Students identify relationships among parts of circles (radius, diameter, circumference); understand congruence; plot negative values on a grid; and recognize two-dimensional shapes that can be folded to make a three-dimensional object.

Jane Scored Below Proficient

WHAT THESE RESULTS MEAN

Your child can use geometric terms but may have trouble identifying the relationships among parts of circles. She may not understand properties of congruent (same size and shape) figures.

NEXT STEPS

Have your child search for real-world examples of geometric shapes. For example, pies are often cut from the center, so the edge of a slice is a radius. Also, streets may be examples of parallel and perpendicular lines.

Patterns, Functions and Algebra

Students can write rules to represent patterns; use variables as unknown quantities; create and interpret equations and inequalities; and use graphs and tables to draw conclusions and make predictions.

Jane Scored Near Proficient

WHAT THESE RESULTS MEAN

Your child can use rules, models, tables, and graphs to represent and describe patterns. She can create equations to represent problems, use variables to represent unknowns and describe the rate of growth over time as constant or varying.

NEXT STEPS

Tell your child a rule (e.g., multiply by 5) and a number, and have her use the rule to tell you what number the rule would generate. Have her determine her own rule and use words, a table or a graph to show how the rule works.

Data Analysis and Probability

Students read, construct and interpret frequency tables, circle graphs, line graphs, and more complex displays of data. They understand the meaning of range, mean, median, and mode. They use ratios to represent the probability of simple events.

Jane Scored Near Proficient

WHAT THESE RESULTS MEAN

Your child can read and construct graphs. She can identify the probability of events, list all possible outcomes in a situation, and identify the range, mean, median, and mode of the set of data.

NEXT STEPS

Find a graph in a magazine or newspaper and ask your child questions such as "What does the graph tell you?" "Could the data be displayed in a different kind of graph?" Ask how the graph might change if additional data were collected.

DRAFT

Spring 2013 012345.128

Science Achievement Results

State Average Score: 415

District Average Score: 392

School Average Score: 392

Jane's score is 396.

She has performed at the basic level and is not meeting standards for Grade 5 Science.

Advanced - Students apply science facts and recognize relationships. They design investigations, draw conclusions, and apply knowledge to new situations.

Accelerated - Students use science information to discuss patterns; make reasonable predictions; make plans to collect data; and evaluate technological solutions.

Proficient - Students know science ideas and use them to make connections. They plan and carry out investigations and use the results to draw logical conclusions.

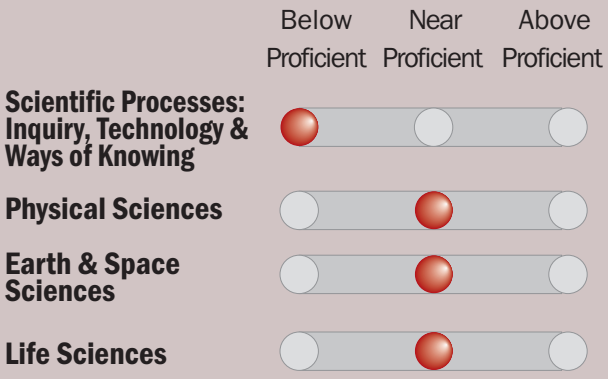
Basic - Students know some science facts and may know how they are connected. They may rely on simple ideas and facts to make obvious predictions.

Limited - Students may know few science facts and might have difficulty describing models or relationships. They may struggle to plan science investigations.

DRAFT

Different versions of the test are used each time the test is given. The scores in this report are used to compare performance from year to year. Scores in different subjects cannot be compared.

Has Jane reached proficient in the different areas of Science?



This chart shows you how well Jane performed in each standard. She is below proficient in Scientific Processes, near proficient in Physical Sciences, near proficient in Earth & Space Sciences, and near proficient in Life Sciences.

Note: There is some uncertainty in all test scores. Please see the interpretive guide for more information.

What Are Your Child's Strengths and Weaknesses in Science?

See the released test questions from earlier years' achievement assessments at

www.success.ode.state.oh.us

Scientific Processes: Inquiry, Technology and Ways of Knowing

Jane Scored Below Proficient

Students design and safely conduct experiments. They know how to share their results with others and they use observations to make their own conclusions. Students learn about the effects of technology. They use a process (method) to solve problems.

WHAT THESE RESULTS MEAN

Your child may not be able to design or make conclusions from experiments. She may not be able to describe the effects of technology. She may be able to use a process to solve problems, but may not be able to explain that process.

NEXT STEPS

Review your child's notes from a class experiment. Ask her questions that help her explain the experiment to you. Talk with her about the effects of technology on your lives and how scientific processes (like record keeping) are used daily.

Physical Sciences

Jane Scored Near Proficient

Students compare properties and movement of objects. They explain physical changes (like melting ice) and chemical changes (like iron rusting). Students trace the flow of electricity through a circuit (like a light bulb attached to a battery by wires).

WHAT THESE RESULTS MEAN

Your child may be able to describe objects by their properties, but may struggle to compare physical changes (like ice melting) and chemical changes (like iron rusting). She may not be able to fully describe the properties of light and sound.

NEXT STEPS

Discuss common physical changes (like ice melting) and chemical changes (like iron rusting). Show her how electricity flows through a circuit (like a bulb connected to a battery by wires). Discuss how heat is transferred between objects.

Earth and Space Sciences

Jane Scored Near Proficient

Students explain Earth's cycles (like seasons) and its movement around the sun. They have knowledge of weather concepts and patterns, and can explain how weather and other processes shape Earth's surface. They describe ways to save natural resources (like trees).

WHAT THESE RESULTS MEAN

Your child may know Earth's place in the solar system. She knows some weather concepts and patterns, but may have difficulty explaining how weather and other processes shape Earth's surface. She can describe some ways to save natural resources (like trees).

NEXT STEPS

When traveling with your child, discuss how wind, water and ice shape the land (for example, rainfall can erode hills). Also, help her record local weather on a calendar or map.

Life Sciences

Jane Scored Near Proficient

Students compare the life cycles of plants and animals. They know how the structures of plants (e.g., flowers) and body parts of animals (e.g., teeth) help them survive. They explain how energy flows through an ecosystem (like a forest).

WHAT THESE RESULTS MEAN

Your child may be able to describe life cycles of plants or animals. She may have difficulty comparing life cycles. She may be able to tell how survival depends on changes in the environment, and the purpose of plant and animal parts (like leaves and wings).

NEXT STEPS

Have your child describe or draw two life cycles. Ask her to tell you what is the same and what is different about them. Discuss with her how plants and animals obtain food. Have her draw a food chain and ask what eats what and why.

DRAFT

Spring 2013 012345.128

To the Family of Jane Smith

DRAFT

Student Name: Jane M. Smith
Test Date: Spring 2013 **Birth Date:** 12/31/2001
Grade: 10
School: ABC School 1 (654321)
District: ABC District 1 (123456)

Online Resources for the Ohio Graduation Tests

- www.success.ode.state.oh.us
- education.ohio.gov
  Search for *OGT*

Dear Family,

In March, Jane took the Ohio Graduation Tests (OGT), which measure student progress and are one of the requirements for a high school diploma. Your student's scores are in this report.

The OGT is based on Ohio Academic Content Standards, which are what students should know and be able to do by the time they leave high school. These standards were developed by Ohio teachers, parents and the community. Educators and state policy makers believe that Ohio needs to and can rise to high expectations. The Ohio legislature made passing tests a graduation requirement in 1987.

Many resources are available to students on the ODE website. We hope your student is taking advantage of these resources to pass the OGT in order to earn a high school diploma. These resources are available at www.success.ode.state.oh.us. From the main page, click on "OGT" and go to the student section.

If your child did not achieve the proficient level on this test, she should keep trying to pass the OGT. She can go to the ODE website and use the information and practice tests there to help study.

This report explains what Jane's test scores mean and suggests ways that you can help. I encourage you to talk to Jane's teachers about this report and resources that can help to ensure your child's success.

I also want you to know that there will be **new State and Local Report Cards. The Local Report Card grades your school district and school on how well they are doing in educating their students.** The new 2013 Local Report Cards are parent and student friendly and show grades from A-F on nine measures of student progress in learning. Ask your principal to explain the new Report Card for your school.

We wish Jane much success. Thank you for all you do to support her in school.

Sincerely,

Richard A. Ross

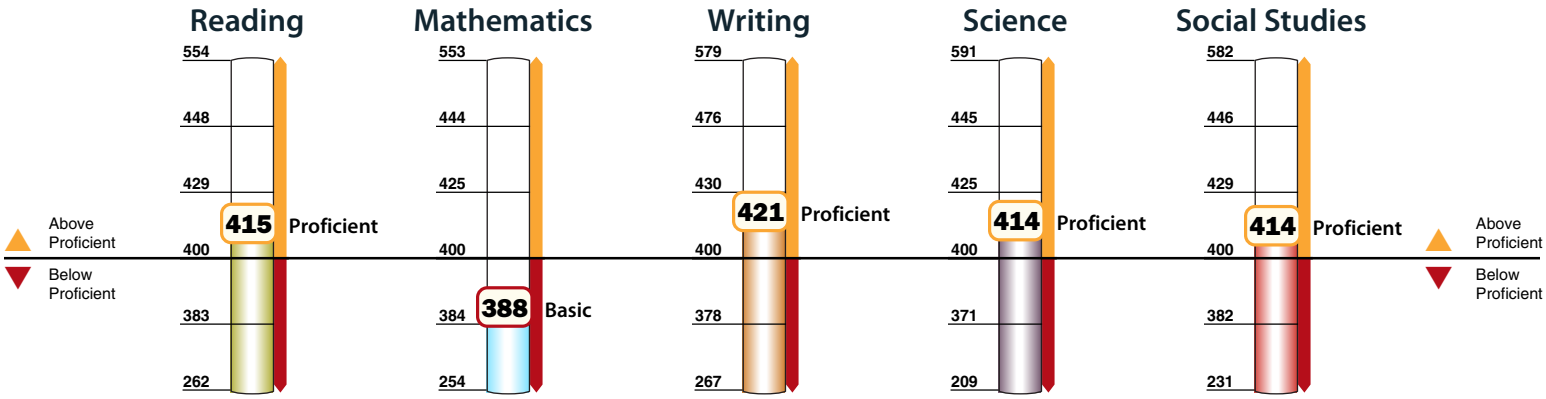
Dr. Richard A. Ross
Superintendent of Public Instruction

DRAFT

Place postage here

To the Family of Jane M. Smith

How did Jane perform on the Ohio Graduation Tests in Spring 2013?



In Spring 2013, Jane passed the: Reading OGT, Writing OGT, Science OGT, Social Studies OGT

In Spring 2013, Jane did not pass the: Mathematics OGT

Jane's Overall Summary

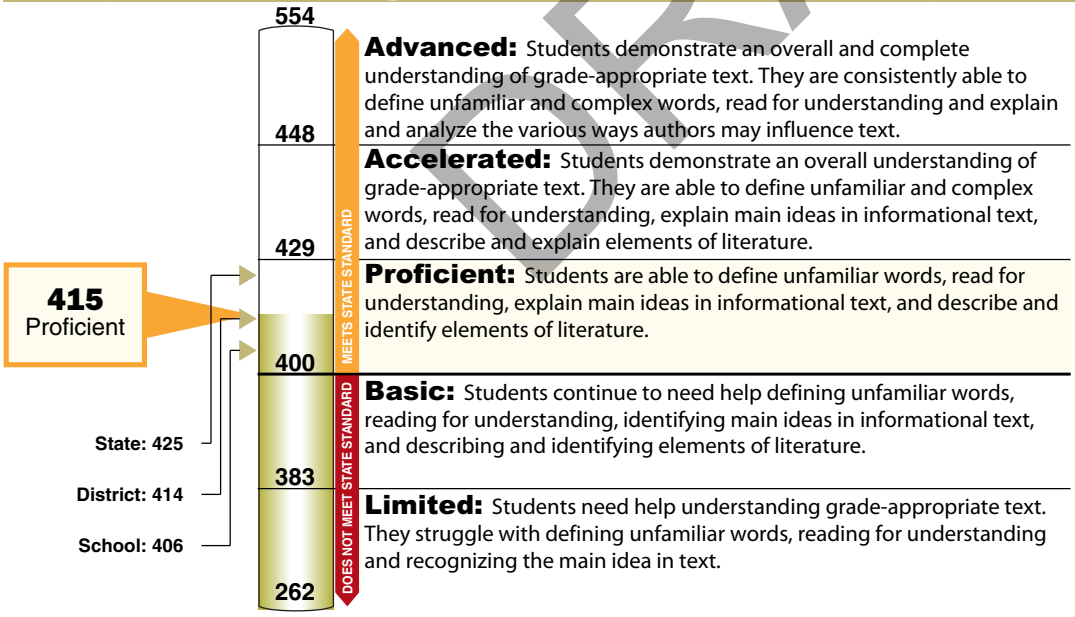
Jane has scored proficient or better on the Reading, Writing, Science, and Social Studies OGT. Jane has not reached the proficient level on the Mathematics OGT. Talk to Jane's teachers about her performance in all subjects and about how you can help prepare her for future education and career options. Jane must pass the OGT in all subjects and meet state curriculum requirements to receive an Ohio high school diploma.

Review the Interpretive Guide and the ODE Web site for information about these score reports and the construction of the OGT, including detailed test statistics.

DRAFT

For practice tests, please go to www.success.ode.state.oh.us

Jane passed the Reading OGT with a score of 415 (Proficient).



Advanced: Students demonstrate an overall and complete understanding of grade-appropriate text. They are consistently able to define unfamiliar and complex words, read for understanding and explain and analyze the various ways authors may influence text.

Accelerated: Students demonstrate an overall understanding of grade-appropriate text. They are able to define unfamiliar and complex words, read for understanding, explain main ideas in informational text, and describe and explain elements of literature.

Proficient: Students are able to define unfamiliar words, read for understanding, explain main ideas in informational text, and describe and identify elements of literature.

Basic: Students continue to need help defining unfamiliar words, reading for understanding, identifying main ideas in informational text, and describing and identifying elements of literature.

Limited: Students need help understanding grade-appropriate text. They struggle with defining unfamiliar words, reading for understanding and recognizing the main idea in text.

Help Jane prepare for post-high school success in reading

Jane has passed the OGT in reading, scoring at the proficient level. Encourage her to build on her success by taking challenging English courses. Talk to Jane about her reading interests, and encourage her to speak with members of the community to find careers where reading skills can be used.

Did you know?

The Public Policy Institute of California has found that taking above-level English courses is predicted to increase future earnings more than taking average-level English courses.

Help Jane prepare for post-high school success in writing

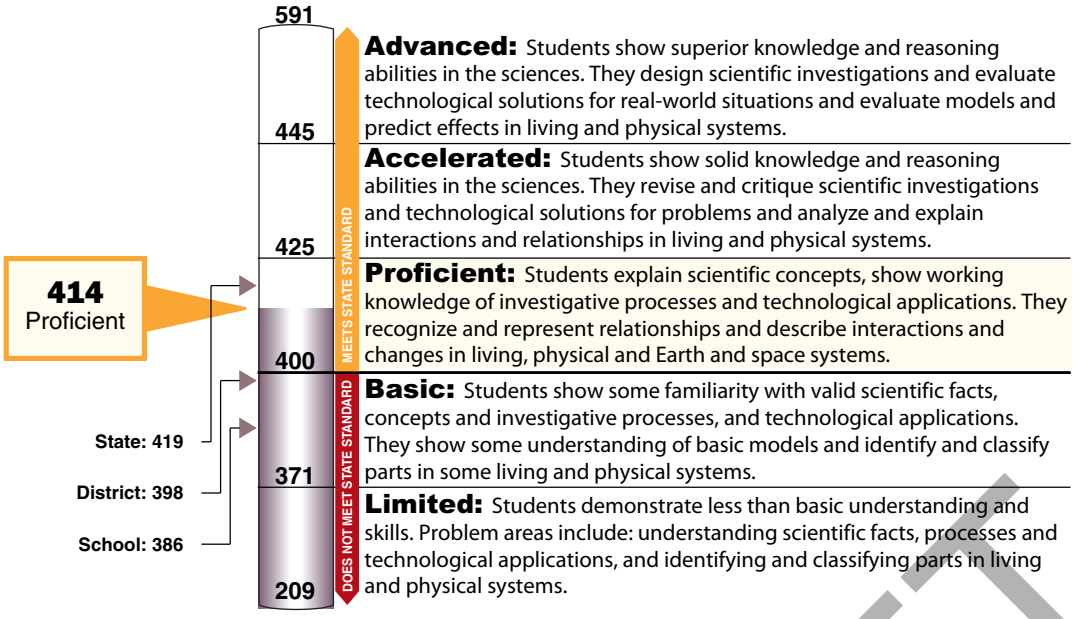
Jane has passed the OGT in writing, scoring at the proficient level. Encourage her to build on her success by continuing to enroll in writing classes. Meet with Jane and her counselor to discuss her interest in writing. Help Jane research writing-related careers and extracurricular activities.

Did you know?

According to the College Board, government economists expect job growth for writers to be faster than the average for all careers through 2014.

DRAFT

Jane passed the Science OGT with a score of 414 (Proficient).



Advanced: Students show superior knowledge and reasoning abilities in the sciences. They design scientific investigations and evaluate technological solutions for real-world situations and evaluate models and predict effects in living and physical systems.

Accelerated: Students show solid knowledge and reasoning abilities in the sciences. They revise and critique scientific investigations and technological solutions for problems and analyze and explain interactions and relationships in living and physical systems.

Proficient: Students explain scientific concepts, show working knowledge of investigative processes and technological applications. They recognize and represent relationships and describe interactions and changes in living, physical and Earth and space systems.

Basic: Students show some familiarity with valid scientific facts, concepts and investigative processes, and technological applications. They show some understanding of basic models and identify and classify parts in some living and physical systems.

Limited: Students demonstrate less than basic understanding and skills. Problem areas include: understanding scientific facts, processes and technological applications, and identifying and classifying parts in living and physical systems.

Help Jane prepare for post-high school success in science

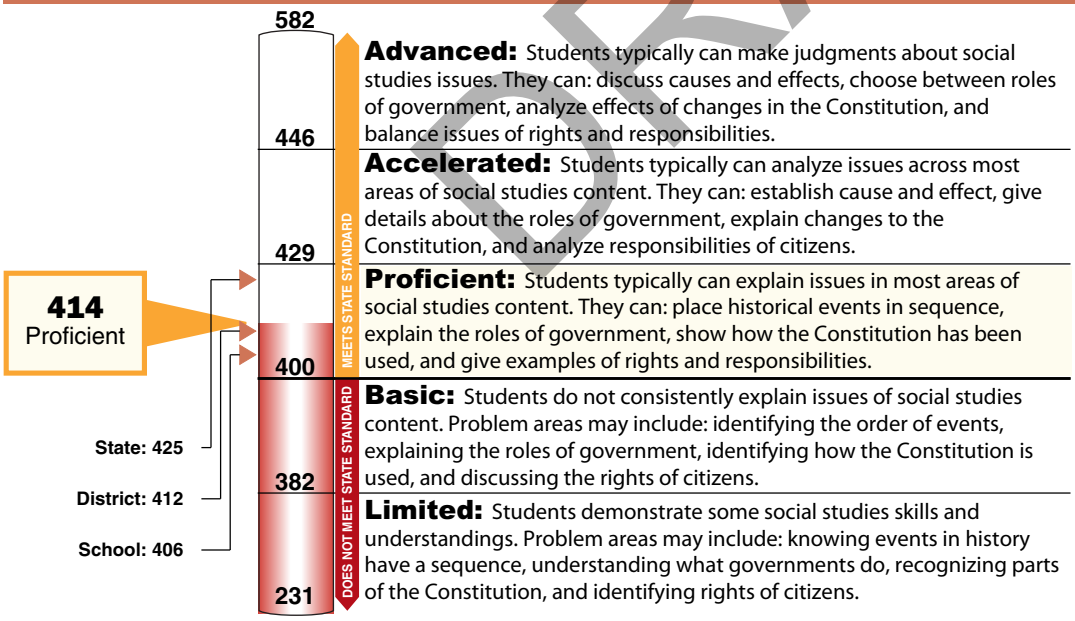
Jane has passed the OGT in science, scoring at the proficient level. Encourage her to build on her success by continuing to take science courses. Help Jane research science-related professions and discuss ways that Jane can continue her science education after graduation.

Did you know?

According to the U.S. Department of Labor, seven of the projected top 10 fastest-growing occupations in the United States for 2004-2014 are science related.

?

Jane passed the Social Studies OGT with a score of 414 (Proficient).



Advanced: Students typically can make judgments about social studies issues. They can: discuss causes and effects, choose between roles of government, analyze effects of changes in the Constitution, and balance issues of rights and responsibilities.

Accelerated: Students typically can analyze issues across most areas of social studies content. They can: establish cause and effect, give details about the roles of government, explain changes to the Constitution, and analyze responsibilities of citizens.

Proficient: Students typically can explain issues in most areas of social studies content. They can: place historical events in sequence, explain the roles of government, show how the Constitution has been used, and give examples of rights and responsibilities.

Basic: Students do not consistently explain issues of social studies content. Problem areas may include: identifying the order of events, explaining the roles of government, identifying how the Constitution is used, and discussing the rights of citizens.

Limited: Students demonstrate some social studies skills and understandings. Problem areas may include: knowing events in history have a sequence, understanding what governments do, recognizing parts of the Constitution, and identifying rights of citizens.

Help Jane prepare for post-high school success in social studies

Jane has passed the OGT in social studies, scoring at the proficient level. Encourage her to build on her success by taking advantage of additional social studies-related courses. Encourage Jane to meet with members of the community to research the role that social studies skills play in their careers.

Did you know?

According to the U.S. Department of Labor, about half of the people who choose careers in social studies-related fields work for federal, state and local governments (and most of this work is for the federal government).

Sample Panelist Evaluation Form

Delaware End of Course (EOC-2)
Standard Setting Workshop
July 30-31, 2013

The purpose of this evaluation form is to secure your feedback about the standard setting process. Your feedback will provide a basis for evaluating the training, methods, and materials used during this workshop.

Please complete the information below.

PART I. ABOUT YOU

1.	What positions do you hold? (Mark all that apply.)	❑ Regular Education Teacher ❑ ESL Teacher ❑ Special Education Teacher ❑ Resource Teacher ❑ Administrator/Specialist ❑ Higher Education Instructor ❑ Community Member (Non Educator) ❑ Other (Please specify:_____) ❑ I have a background in English as a Second Language ❑ I have a background in Special Education ❑ I am a parent of a child who attends a K-12 Delaware Public or Charter School
2.	Did you serve as a table leader during the workshop?	❑ Yes ❑ No

PART II. OVERALL EXPERIENCE

1. Please read each of the following statements carefully and indicate your response.

		Strongly Agree	Agree	Disagree	Strongly Disagree
a.	I understood the purpose of this standard setting workshop.	❑	❑	❑	❑
b.	The standard setting method I used during this workshop results in setting valid standards.	❑	❑	❑	❑
c.	The standard setting method I used during this workshop was fair and unbiased.	❑	❑	❑	❑
d.	The training on the standard setting process gave me the information I needed to complete my assignment.	❑	❑	❑	❑

e.	The training on the Performance Level Descriptors (PLDs) gave me the information I needed to complete my assignment.	❑	❑	❑	❑
f.	The feedback data provided gave me the information I needed to complete my assignment.	❑	❑	❑	❑
g.	The impact data provided gave me the information I needed to complete my assignment.	❑	❑	❑	❑

2. Please rate the clarity of the following components of the workshop.

		Very Clear	**Somewhat Clear**	**Somewhat Unclear**	**Very Unclear**
a.	Instructions provided by the Workshop Leader	❑	❑	❑	❑
b.	Ordered Item Booklet (OIB)	❑	❑	❑	❑
c.	Performance Level Descriptors (PLDs)	❑	❑	❑	❑

3. How important was each of the following factors in your placement of the bookmarks?

		Very Important	**Somewhat Important**	**Not Important**
a.	Performance Level Descriptors (PLDs)	❑	❑	❑
b.	My perception of the difficulty of the items	❑	❑	❑
c.	My experiences with students	❑	❑	❑
d.	Small group discussions	❑	❑	❑
e.	Large group discussions	❑	❑	❑
f.	Feedback data	❑	❑	❑
g.	Impact data	❑	❑	❑

4. How appropriate was the amount of time you were given to complete the following components of the standard setting process?

		Too Much	About Right	Too Little
a.	Training on the Bookmark method	❑	❑	❑
b.	Reviewing the Ordered Item Booklet (OIB)	❑	❑	❑
c.	Placement of your bookmarks in each round	❑	❑	❑
d.	Round 1 discussion	❑	❑	❑
e.	Round 2 discussion	❑	❑	❑

PART III. STANDARD SETTING OUTCOME

Are you generally satisfied with the placement of the cut points?	❑ Yes ❑ No Please explain: _____ _____ _____

PART IV. YOUR TURN

What was the most effective portion of the training or standard setting process?

_____

_____

_____

_____

What suggestions do you have to improve the training or standard setting process?

_____

_____

_____

_____

Thank you for participating in the Delaware End of Course (EOC) Standard Setting Workshop!

** The Test Monitor Training Site allows authorized users to create practice test sessions that students can log into using the Online Item Samplers. For additional information, refer to the *Test Monitor User Guide for the Online Testing System*, which is available on the Resources section of the Minnesota Assessments portal.

*** While any user may *access* Learning Point Navigator, only those who have a **school-level role** and who are **associated with student rosters** can create and edit assignments for those students.

Appendix N:

Smarter Balanced Draft Policy

Availiability of Consortium Resources to Non-members

Consistent with the priorities of its member states, the Smarter Balanced Assessment Consortium is committed to maintaining the value of Consortium membership while creating opportunities for students in non-member states to benefit from the Smarter Balanced Assessment System.

Value Proposition of Consortium Membership

Governing members in the Consortium have control over:

- **Cost drivers for assessment implementation:** Members control the length of the test, the emphasis of content on the test, and the types of items that will be presented to students
- **The operational budget:** Members develop and approve the Consortium's membership fees and expenditures
- **The scope of services:** Members are able to ensure that the Consortium provides the services that their members and stakeholders require

Value Proposition for Maintaining and Enhancing the Assessment System

Consortium governing members will work together to maintain and enhance the usefulness and value of the system by:

- Developing and calibrating additional secure assessment items to better measure the depth and breadth of College and Career Readiness Content Standards
- Developing additional non-secure assessment items to better allow teachers to measure the progress of students throughout the school year
- Developing additional formative tools and supports to better improve teaching and learning
- Supporting the open source implementation of the Smarter Balanced test administration, data warehouse, item archive and authoring tool, and digital library
- Monitoring item exposure, exposure and use of other secure and non-secure assessment resources
- Maintaining existing and securing new copyright agreements
- Protecting the security of Consortium materials
- Providing communication materials and supports to service providers as required to support the system

Consortium Approach to Sustainability

The Consortium intends to fund services to its members and enhance the assessment system through the collection of annual membership fees to be established by the member states.

Availability of Consortium Resources to Non-Members

The Consortium intends to make Consortium resources available to non-members under the following conditions:

- Non-members will not have the privileges of membership including but not limited to the:
    - Authority to contribute to or approve policy decisions

    - Authority to approve the Consortium's annual budget (i.e., membership fee structure and expenditures)
- Non-members will:
    - Pay a per-student fee equal to the applicable membership fees. (This fee will provide the resources required to address the applicable distribution and management requirements of both secure and non-secure materials
    - Agree to maintain the security of Consortium materials and use materials appropriately based on the Consortium test administration manuals and applicable copyright agreements
    - Agree to Consortium certification requirements if the non-member plans on reporting results on the Smarter Balanced scale
- The Consortium reserves the right to require a security bond contingent on the Consortium's analysis of the security risks posed by non-member use of Consortium materials

Introduction

The Delaware Comprehensive Assessment System (DCAS) includes all students who participate in statewide testing (DCAS and DCAS – Alt1). The Online Reporting System provides data for each student who completes at least one DCAS, DCAS – Alt1, or End of Course (EOC) test, as well as participation reports to determine who has completed testing and who needs to either complete testing or take another test opportunity in a subject. Students who do not take any DCAS, DCAS – Alt1, or EOC tests are not included in the Online Reporting System.

User Guide Organization

This document provides information on the major features of the Online Reporting System, including the Score Reports, Test Management Center, and Manage Rosters.

Section I.	Overview of the Online Reporting System
Section II.	Logging into the Online Reporting System
Section III.	Understanding the Online Reporting System Layout
Section IV.	Search Students (Student Lookup)
Section V.	Score Reports
Section VI.	Manage Rosters
Section VII.	Test Management Center
Appendix:	Data Available in Score Reports

Additional Resources

The *DCAS Subjects and Benchmarks* document provides a comprehensive list of all benchmarks by content area (subject). Administration manuals and other system user guides for DCAS are also available. All documents are available on the DCAS portal (de.portal.airast.org).

Computer and System Requirements

This user guide does not provide information on computer or system requirements. **Only supported operating systems and web browsers can be used to access DCAS applications.** This information is outlined in the *System Requirements* document, also available on the DCAS portal.

User Support

If this user guide does not answer your questions, contact the DCAS Help Desk at the American Institutes for Research (AIR) or the Delaware Department of Education.

- If your user account is unavailable, you cannot otherwise access the Online Reporting System, or you have other technical questions, contact the DCAS Help Desk at AIR.
- For situations in which student data are incorrect or missing, please contact Jim Hertzog or Lisa Alexander at the Delaware Department of Education.
- If you have specific questions about DCAS – Alt1 test data, please contact the DCAS – Alt1 Help Desk.

American Institutes for Research DCAS Help Desk Contact Information

Phone: 877.560.8331
E-mail: DCASHelpDesk@air.org

Mondays–Fridays (except holidays)
Hours: 5:00 a.m. to 10:00 p.m.

DCAS – Alt1 Help Desk Contact Information

Phone: 877.206.7039
E-mail: DCASalt1helpdesk@air.org

Mondays–Fridays (except holidays)
Hours: 7:00 a.m. to 6:00 p.m.

In order to assist with your issue, provide the Help Desk with detailed information that may include the following:

- The SSID of the student who was affected by the issue
- Any error messages that appeared
- Operating system and browser information (if a functional question)

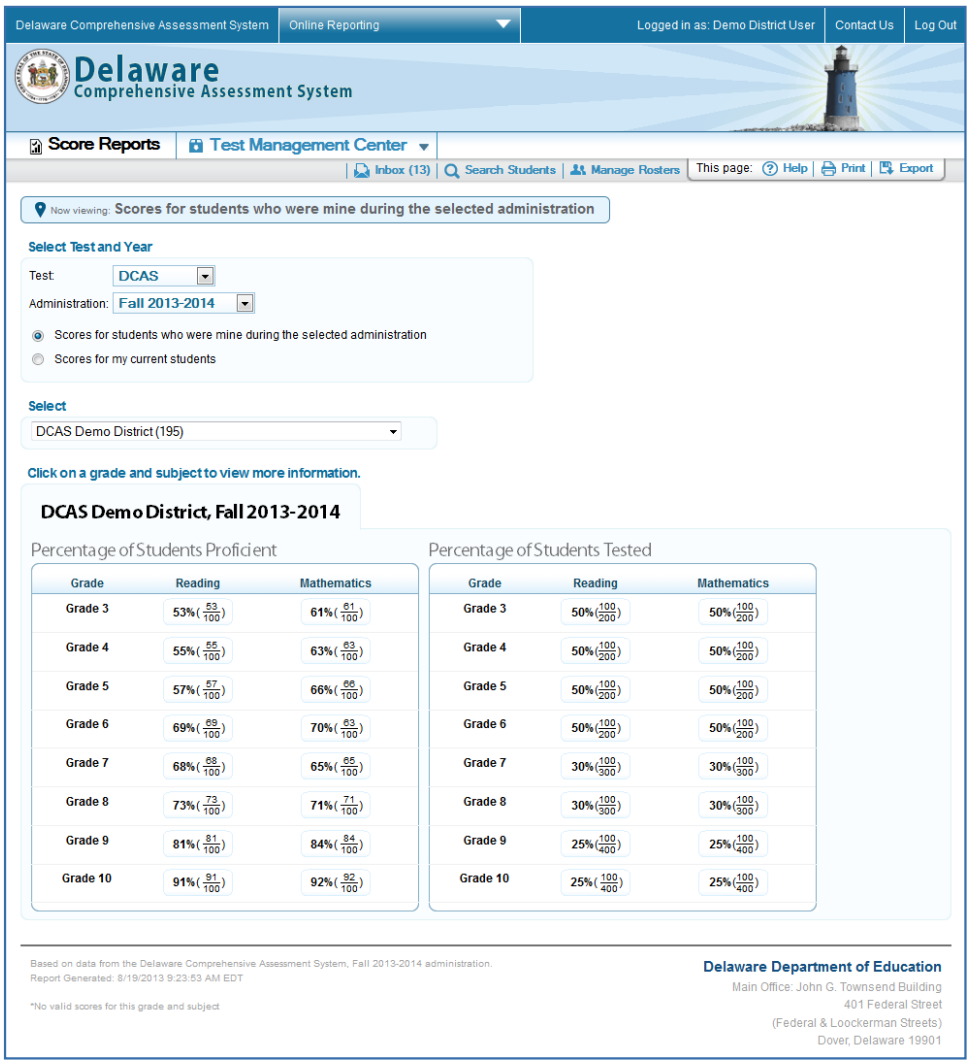
Section I. Overview of the Online Reporting System

The DCAS Online Reporting System (ORS) contains two major applications: Score Reports and the Test Management Center.

- The **Score Reports** (previously Performance Reports) provide **score** data for each of the DCAS, EOC, and DCAS – Alt1 tests. Users can compare score data between individual students and the school, district, or overall state average scores. Information on benchmark strengths and weaknesses is also available by reporting category.
  (Note: Test Administrator [TA] users cannot access score reports data.)
- The **Test Management Center** provides **participation** data for students who are taking the DCAS, DCAS – Alt1, or EOC tests. Users can determine which students need to complete testing and who may need to take another opportunity of a test. Users can also view participation summary statistics (count and percentages) of students who tested in a selected subject and grade level.

All reports and features are accessible at any time from the top of the screen, just below the DCAS banner. The [**Score Reports**] button links to the Online Reporting System home page.

Online Reporting System Home Page



Score Reports (Home)

Score reports allow authorized users to view aggregated scores for districts, schools, teachers, and rosters, as well as individual student performance data for the DCAS, EOC, DCAS – Alt1, and Norm-Referenced/TerraNova (2010–2011) tests. Users can take advantage of data analyses to determine what strategies may need to be implemented to improve teaching and learning.

Score reports features include:

- The ability to download rosters as a data file from any aggregation.
- Enhanced disaggregation with the "Breakdown By" tool, which allows users to sort individual students or rosters by subgroups such as gender.
- A % Completed opportunity column, which displays the total percentage of students in the aggregation who have completed each of the two test opportunities delivered during the spring DCAS testing window (to date). *(This column does not appear for the DCAS – Alt1 or EOC tests.)*
- Benchmark reports, which provide a granular analysis of a roster's relative strengths and weaknesses. These reports also link to Learning Point Navigator. *(These reports are available for DCAS Mathematics, Reading, and Science tests only.)*
- A test condition events filter (Test Events), which allows users to view data by accommodation code or type. This feature is available for the subject detail reports. *(Note: This feature is available beginning with the Fall 2013 test administration.)*

Reminder: Student performance data in the Online Reporting System are not the final quality - checked data used for accountability purposes.

For more information, refer to Section V.

Test Management Center

The Test Management Center allows authorized users to generate customized reports showing students' activity in the online testing system, view summary statistics, and retrieve data.

For more information about the Test Management Center and participation report filters, refer to Section VII.

Inbox

The Inbox link in the header row is a quick link to the Test Management Center's "Retrieve Student Results" section and allows you to access student performance data files. You can also access batch Individual Score Report files in PDF format. These files are generated from the Student Listing Report page.

Manage Rosters

You can add or edit rosters in the Online Reporting System. These rosters are also used in Learning Point Navigator. For more information, refer to Section VI.

Search Students

The student search feature allows you to find students by SSID or by first or last name and directly access their test results. This feature searches for score report results for students, not their test status(es) for the current test window. For more information, refer to Section III.

New Features and Changes for 2013–2014

Score Reports: Home: Reporting Student Counts

On the Home page, student counts will now be displayed in the Percentage of Students Proficient and Percentage of Students Tested tables.

- In the Percentage of Students Proficient table, the count will display the number of students in the selected school or district who achieved a proficient or better rating out of the total number of students who took the subject and grade test (e.g., 47/75).

- In the Percentage of Students Tested table, the count will display the number of students in the selected school or district who took the test out of the total number of students eligible for the subject and grade test (e.g., 35/100).

Score Reports: Test Events Filter

The Test Events filter will allow users to filter score data based on a selected accommodation (e.g., text-to-speech). This feature is available starting from the current test year. The report data will filter into two groups: those who had the selected accommodation enabled, and those who did not have the accommodation.

This filter is available on the Subject Detail Report and Student Listing Report. The Individual Student Report will also display a table listing the accommodation(s) the student had.

Score Reports: Individual Score Reports: Test Accommodations

The Individual Score Reports will now display test accommodations information for the selected subject test. This information is available beginning with Fall 2013 assessments.

Score Reports: Print Student Score Reports to PDF

The Individual Student Report is now also available as a downloadable PDF. Simply click [**Print**] to generate the file, which can be saved.

On the Student Listing Report, the [Print] button will generate a single PDF file containing the Individual Student Report for each student listed. The generated file will be delivered to the Inbox, where it can be downloaded and saved.

Test Management Center: Plan and Manage Testing: New Parameters

In addition to selecting the test, administration, and test name for the participation reports, you can also filter by demographic subgroup as well as test condition events.

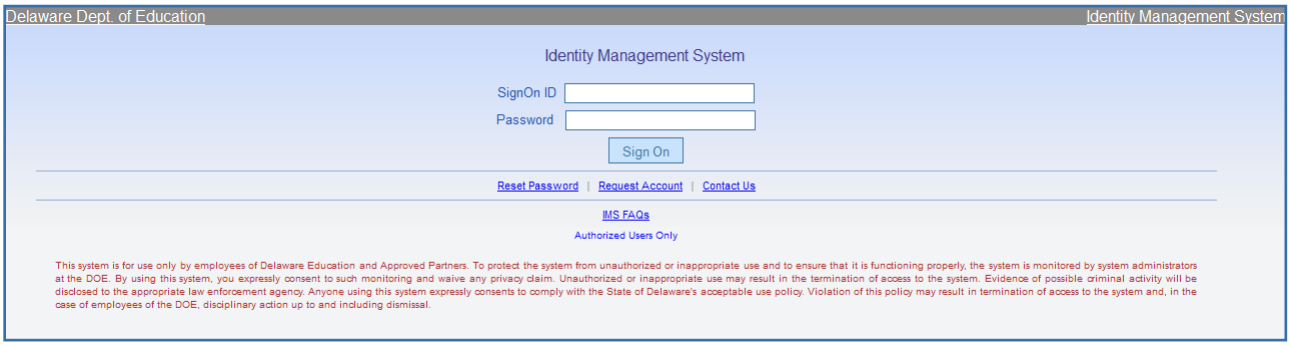
Test Management Center: Plan and Manage Testing: Updated Test Statuses

Upon selecting the test type (e.g., DCAS or DCAS – Alt1, the status filter will update automatically to only display the test statuses that apply to the selected test). Statuses that do not apply to the alternate assessments will not be displayed.

Section II. Logging into the Online Reporting System

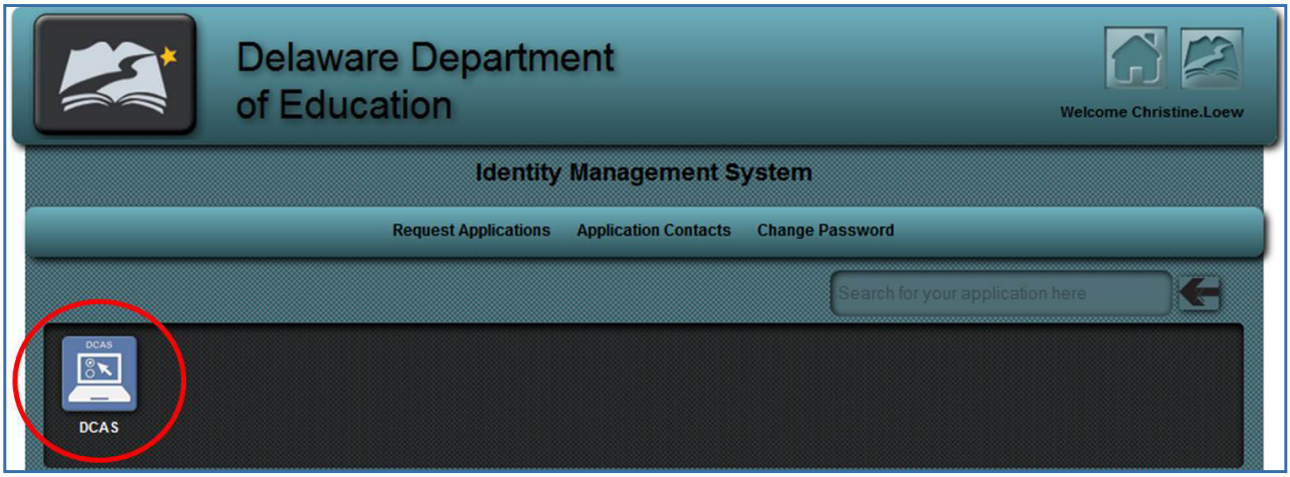
All DCAS application sites, including the Online Reporting System, are accessed through DDOE's Identity Management System (IMS) application.

1. Access the DDOE IMS login page at https://login.doe.k12.de.us. Use your regular IMS ID and password to log in.



2. After you have successfully logged into IMS, you will see a list of applications available to you, including DCAS.

   - Click the [**DCAS**] button from the IMS menu. You will be directed to the DCAS portal.



3. Click either the [**Test Administrators/Coordinators**] or [**Administrators and Teachers**] button to access DCAS applications.

---

4. Click the [**Online Reporting System**] button. If you are authorized to access this application, you will be automatically directed to the Online Reporting System home page. You will not have to log in again.

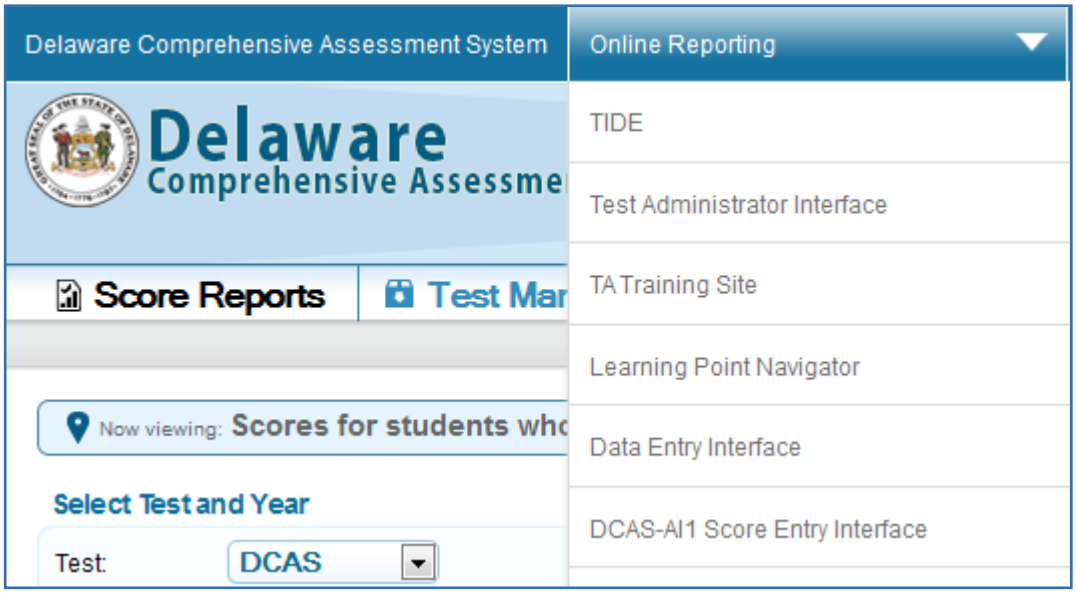
Navigating between DCAS Applications (Common Login System)

After you have logged into a DCAS system, you can switch between applications without needing to log out or log in again. This Common Login System (CLS) integrates the following DCAS applications:

- Online Reporting System
- TIDE
- Test Administrator Interface
- TA Practice and Training Site
- Learning Point Navigator
- Data Entry Interface
- DCAS – Alt1 Score Entry Interface

CLS is designed to ease the login process and simplify navigation between DCAS applications. After logging into your account, you will remain signed into DCAS as long as one of your browser windows remains on a DCAS system. (System timeout rules apply.)

The top left corner of your browser contains a drop-down menu listing all DCAS systems. Your current application is displayed to the left of this drop-down menu.



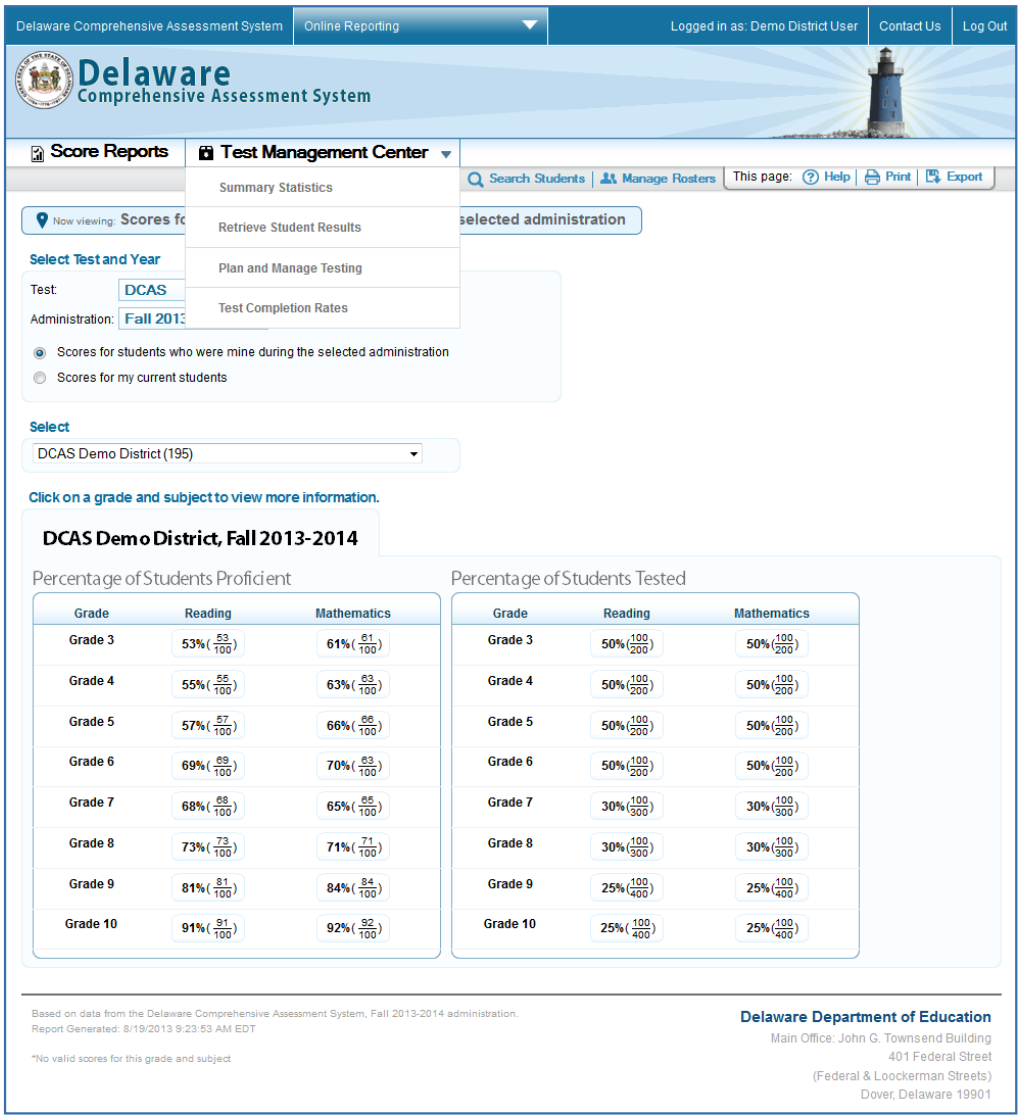
Select the application you want to switch to using the drop-down menu. Although navigating to another DCAS system is easy, it is important to understand how the system operates in order to avoid unintended consequences of switching systems.

If you are also using the TA Interface application and you log out of the Online Reporting System, this action will also log you out of the TA Interface. Your test session will stop and all students in the session will be logged out. You cannot resume your session. You will have to create a new session and your students will have to log in again to resume testing.

Section III. Understanding the Online Reporting System Layout

All Online Reporting System features are available from any page in the system. Links are visible just below the DCAS banner.

Online Reporting System Home Page With Test Management Center Drop-Down Menu



- The [**Score Reports**] button links to the score reports.
- The [**Test Management Center**] button provides a drop-down menu containing the four Test Management Center sections:
  - Summary Statistics and My Testing Windows
  - Retrieve Student Results (Download Data Files)
  - Plan and Manage Testing
  - Test Completion Rates **(New!)**
- The [**Inbox**] button is a quick link to the Retrieve Student Results section in the Test Management Center.

- The [**Search Students**] button opens a pop-up window that allows you to search for a student by SSID or by first or last name and access his or her test results from a current or previous test administration.
- The [**Manage Rosters**] button allows authorized users to add and manage their own rosters.

All authorized DCAS users except Test Administrators (TA) can access all features. Test Administrators may access the Test Management Center. Test Administrators with Reporting Access (TAR) can access all features of the Online Reporting System.

Important: Use the on-screen buttons and tools to navigate within the Online Reporting System. Do not use your web browser's back button.

Online Reporting System General Tools

At the top of every screen, below the DCAS banner, are three tools that you can use: *Help*, *Print*, and *Export*. The *Definitions* tool is also available on many screens in the same location.

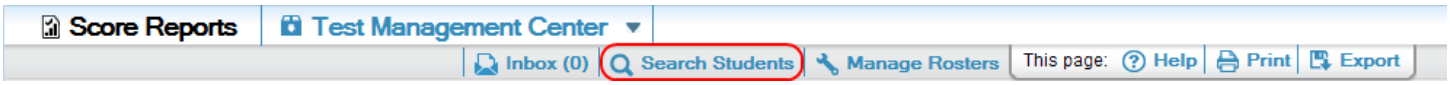
- The [**Help**] button links to this Online Reporting System user guide.
- The [**Print**] button lets you print what you see on the screen.
  - On the Student Listing Report, this feature allows you to print either the student's report or reports for all the students in the selected roster (for the selected test).
- The [**Export**] button lets you export the student data that are visible on the screen. The exported file will be a Microsoft Excel (.xls) file.
- The [**Definitions**] button provides definitions for terms specific to the report you are viewing.

Section IV. Search Students (Student Lookup)

The Online Reporting System includes a feature to look up students by SSID, first name, or last name. This feature is useful if you need to find a student's score reports but do not know the student's grade or school. ***Note: You cannot view students who are not associated with your school or district.***

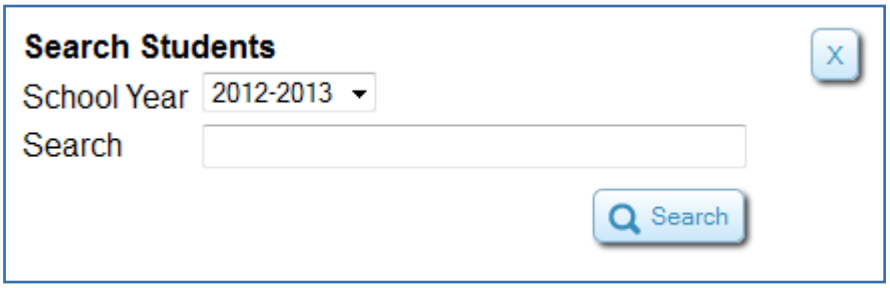
Searching for Students

Users can access this feature by clicking the [**Search Students**] link, which is in between the Manage Rosters and Inbox links. This feature searches for score report results for students, not their test status(es) for the current test window.



If any information for a student is incorrect, the student's profile must be updated in eSchool and DELSIS. DDOE uploads student information to TIDE on a nightly basis. Student records should be updated within 48 hours. After a student's record is updated, he or she can begin testing.

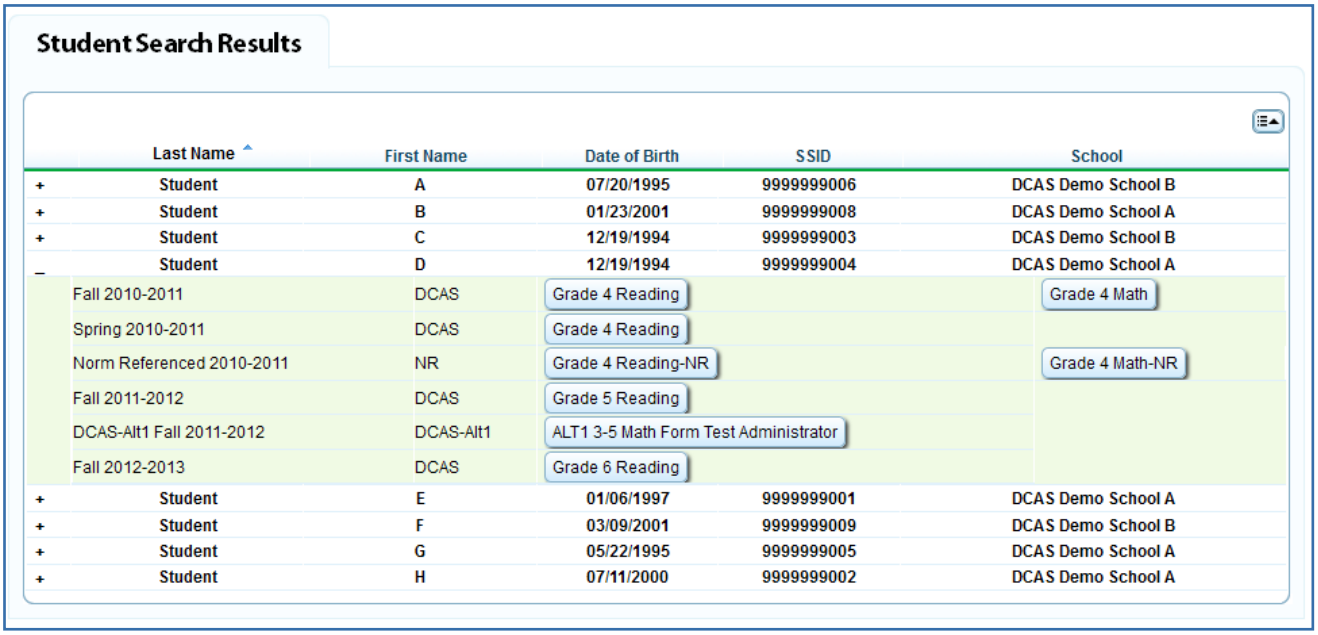
Student Search



1. Click the [**Search Students**] button from any screen in the Online Reporting System.
2. Select the school year you want to limit your search to (e.g., 2012–2013; 2011–2012).
3. Enter the search criteria:
   a. Enter up to 20 students' full or partial SSIDs. If you are entering multiple queries, you must separate each one with a comma (e.g., 9999999005, 9999999007).
   b. Enter a student's first name or last name, but not both.
4. Click the [**Search**] button. If the search results in a match, those students' information will display.

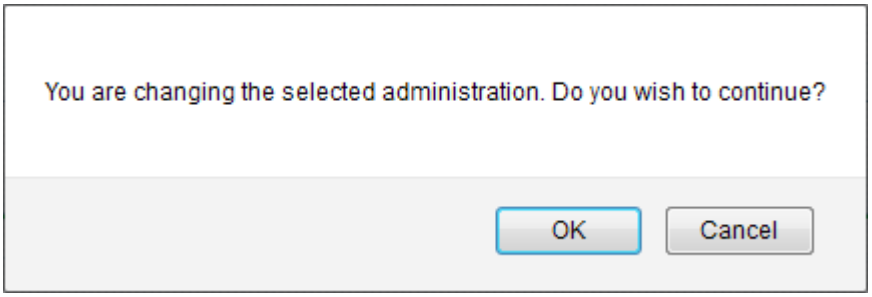
Understanding Student Search Results and Selecting a Test

The search results will show a list of students who matched your search.



- **To view the tests a student has taken,** click the [+] icon in the first column. This will expand the student row.
- **To view the student's performance on a test,** click the test name button. Be sure to note the test administration for the test that you are selecting (listed in the left column).

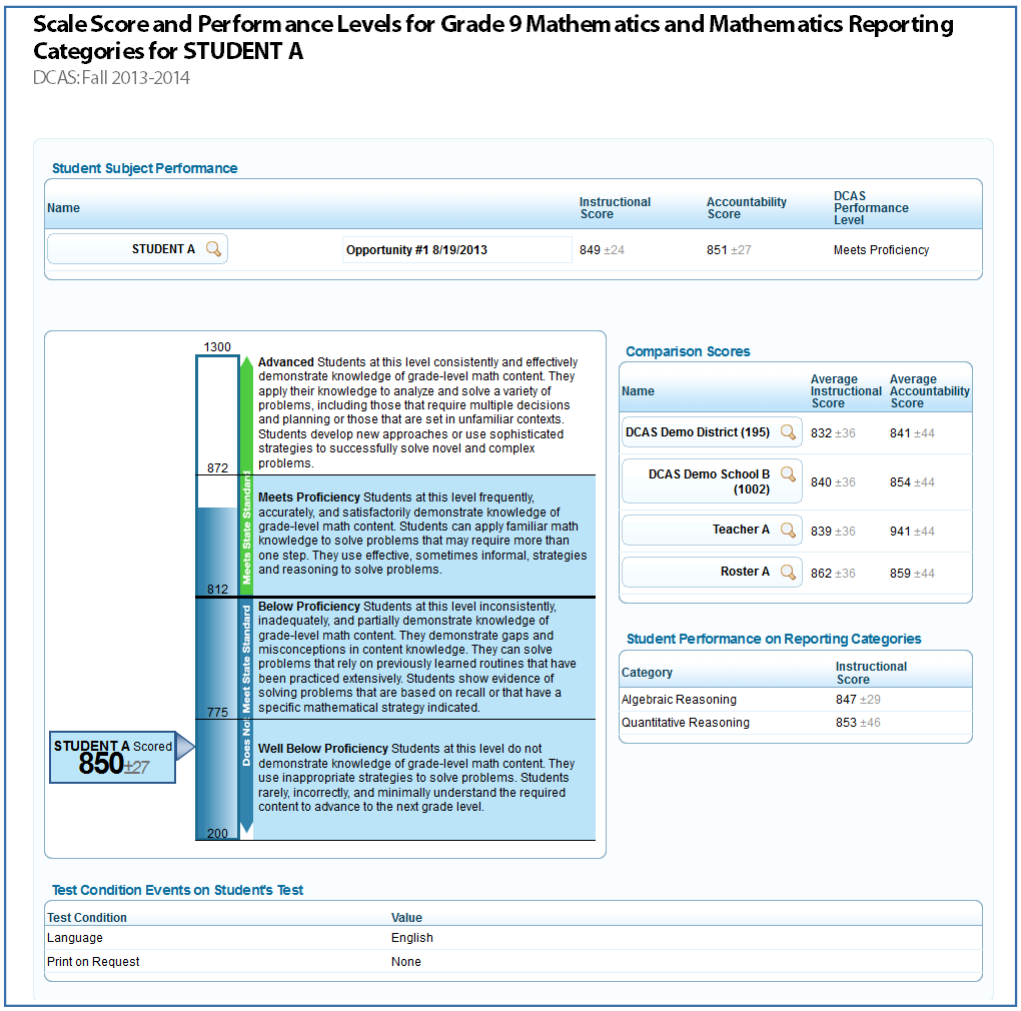
Note: If you are selecting a student's test that is from a different administration than the one that was selected on your home screen, you will be prompted with a message asking you to confirm that you want to change test administrations. Click [OK] to continue.



Viewing a Selected Student's Test Results

This page displays the student's performance for the test that you selected. As with any individual student score report, you can compare the selected student's performance with your school and district's average performance.

New: This report now includes a table displaying any accommodations that the student used for the selected subject test.



For example, the demo student above earned an Accountability Score of 939 with a conditional standard error of measurement (SEM) of 39, and an Instructional Score of 953 with an SEM of 39. This student's performance falls within the "Advanced" category.

Now compare these to the average instructional and accountability scores listed in the "Comparison Scores" box on the right side of the page. You can see that this student's scores are higher than the average Instructional and Accountability Scores for the school and district, as well as the average state scores of all students in the state (who have taken the same test to date).

To return to the search results page, click the [**Back to search results**] link.

Section V. Score Reports

Score reports provide performance data to users at the state, district, school, teacher, and roster levels, as well as data for individual students. All score reports data, except for individual students' reports, can be disaggregated into AYP categories for detailed analysis.

The Online Reporting System presents data on the aggregate and individual performance of students as their online tests (DCAS, EOC, and DCAS – Alt1) are completed and submitted. It does not take into account any accountability rules. Data presented in this system should be considered preliminary.

All score data can be compared with the overall state and district average for the test you are analyzing. Additionally, you can view performance trends and determine whether overall performance is increasing.

The Online Reporting System allows you to create custom groups of students so that you can analyze aggregated data based on shared characteristics (e.g., student athletes in an enrolled grade). Refer to the Manage Rosters section for additional information.

User Roles in the Online Reporting System

Your user role determines the data you can view. For example, district users can view data for all schools, teachers, classes, and students in their district; school users can view data only for teachers, classes, rosters, and students in their school.

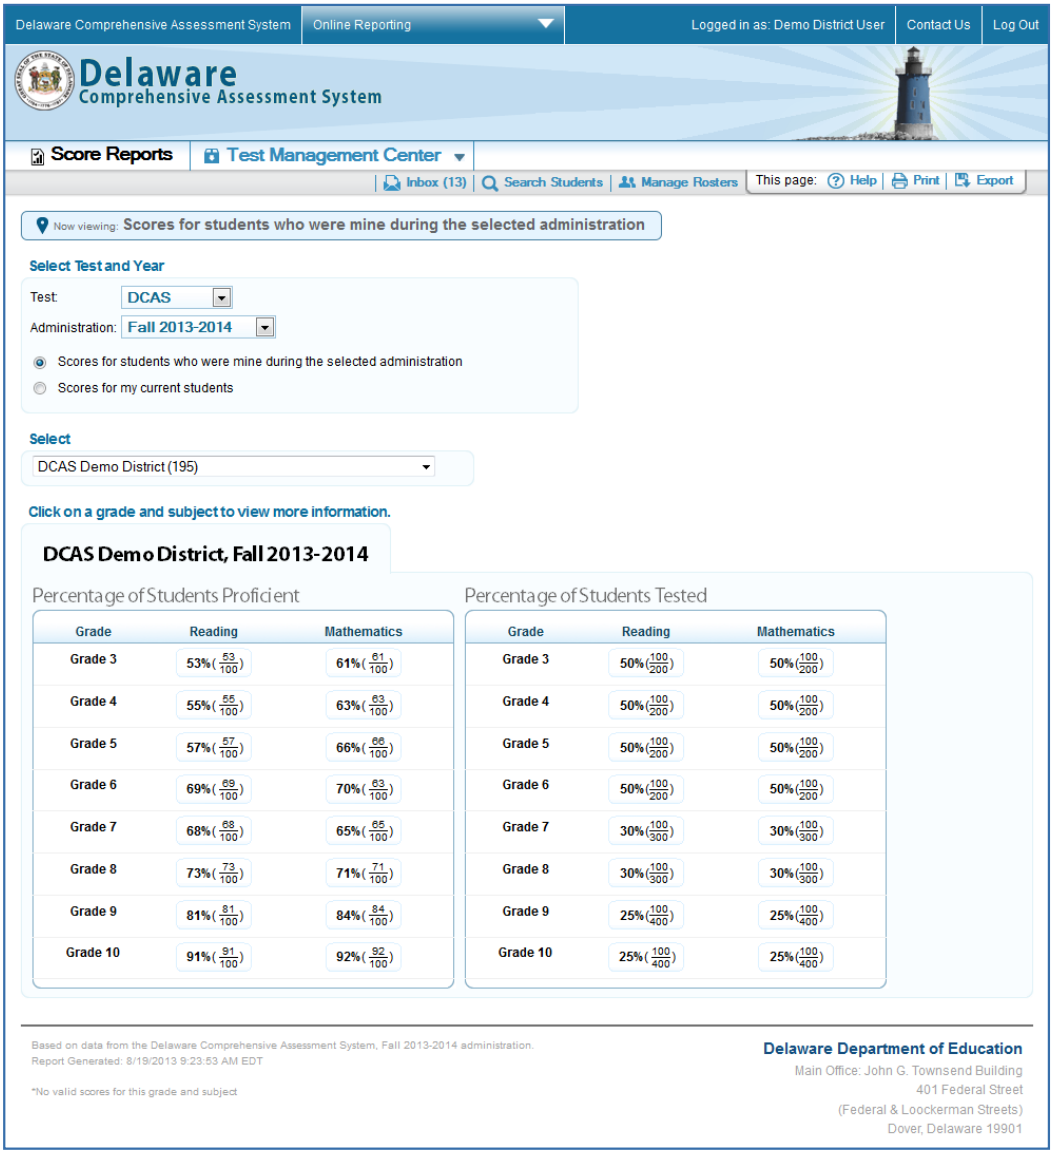
Table 5–1. Score Reports: User Roles and Access

Access Levels and Roles	District-Level Data	School-Level Data	Teacher-Level Data	Roster-Level Data	Student Data
State	✓ (all districts)	✓	✓	✓	✓
District *State Assessment Coordinators (SAC)* *District Administrators (DA)*	✓	✓ (all schools in district)	✓	✓	✓
School *School Administrators (SA)* *Test Administrators with Reporting Access (TAR)*		✓	✓	✓	✓
Teachers (TE and TEALT)		✓	✓	✓	✓

Note: Test Administrators can only access the Plan and Manage Testing and Test Completion Rates sections in the Test Management Center.

Score Reports: Getting Started

When you first access the Online Reporting System, you will see the Home page. By default, this page displays the overall summary of score data and testing progress for your district or school, and is the starting point for data analysis. To return to this page at any time, click the [**Score Reports**] button just below the Online Reporting tab in the banner.



Select Test and Year

In this section, you can select the test and administration for which you want to view score data.

- Available tests include DCAS, DCAS-EOC, DCAS – Alt1, and NR (Norm-Referenced/TerraNova (2010–2011 school year only)). *DCAS is the default option.*
- Available administrations include the following test windows: fall, winter, and spring, through the 2011–2012 school year. For the 2012–2013 school year and beyond, it will be fall and spring administrations only. *The current test window is the default option.*
- Select a "show scores" category (see below).

View Scores by All Students or Current Students

This feature is particularly helpful for school personnel who want to see how new/current students did previously (e.g., students who moved to a school from another school).

- **Scores for students who were mine during the selected administration (default)**
  - This view allows you to see score data for those students who tested in the selected test and administration.
  - ***Note: This option enables you to see data only for students who were associated with your school or district in the selected test and administration.***

- **Scores for my current students**
  - This option allows you to immediately view score data for only those students who are associated to your current rosters.
  - This view also enables you to see your current students' previous strengths and weaknesses before they begin testing this year.
  - For example, if you are a grade 9 teacher and you want to see how your current students performed on the DCAS Fall 2013–2014 tests, select "DCAS" and "Fall 2013–2014" from the Test and Administration drop-down lists. Data from your current students who tested in that window will be displayed in the score reports.
    - ***Note: If you currently have a student who did NOT test in the selected test and administration, no data will be displayed for that student.***

Understanding the Home Page Report Tables

- **Percentage and Count of Students Proficient**—This table displays the percentage and count of students to date who have scored proficient (Meets Proficiency or Advanced) on each DCAS, EOC, and DCAS-Alt1 test. The count is a ratio of the number of students that scored proficient on the test to the number of students that took the test. Data in this table are by grade level for all DCAS and DCAS – Alt1 Science and Social Studies tests and by grade band for DCAS – Alt1 Reading and Math tests.
  Note: Data will not load in this table when viewing the 2010–2011 Norm-Referenced/TerraNova test because there were no proficiency standards for this test.

- **Percentage and Count of Students Tested**—This table displays the percentage and count of students to date who have completed and submitted their test for scoring. The count is a ratio of the number of students who took the test to the number of students who are eligible to take the rest. The percentage of students who tested is calculated out of the total number of students who are currently associated with your school or district and eligible to take the specified test.
  Note: This table is not available for "Show scores for my current students."

Data on this page and all other score report pages are based on the total number of students whose tests have been scored. Students who have completed their tests but not submitted them for scoring will not be included in these data.

To access the score reports for a particular test (by subject and grade or grade band), simply click a cell that contains a percent value. You will be directed to the Subject Detail Report page.

About Score Reports Dimensions

Score reports use three "dimension" categories as the primary means of navigating between report levels: Who, What, and When. This feature allows users to view data that can be analyzed appropriately, depending on whether the focus is on testing group (e.g., school or roster), content type (e.g., subjects or reporting categories), or period of time (trend).

Note: Not all dimension categories are available at all times. Available categories are dependent on your user role and the report type and level you are viewing.

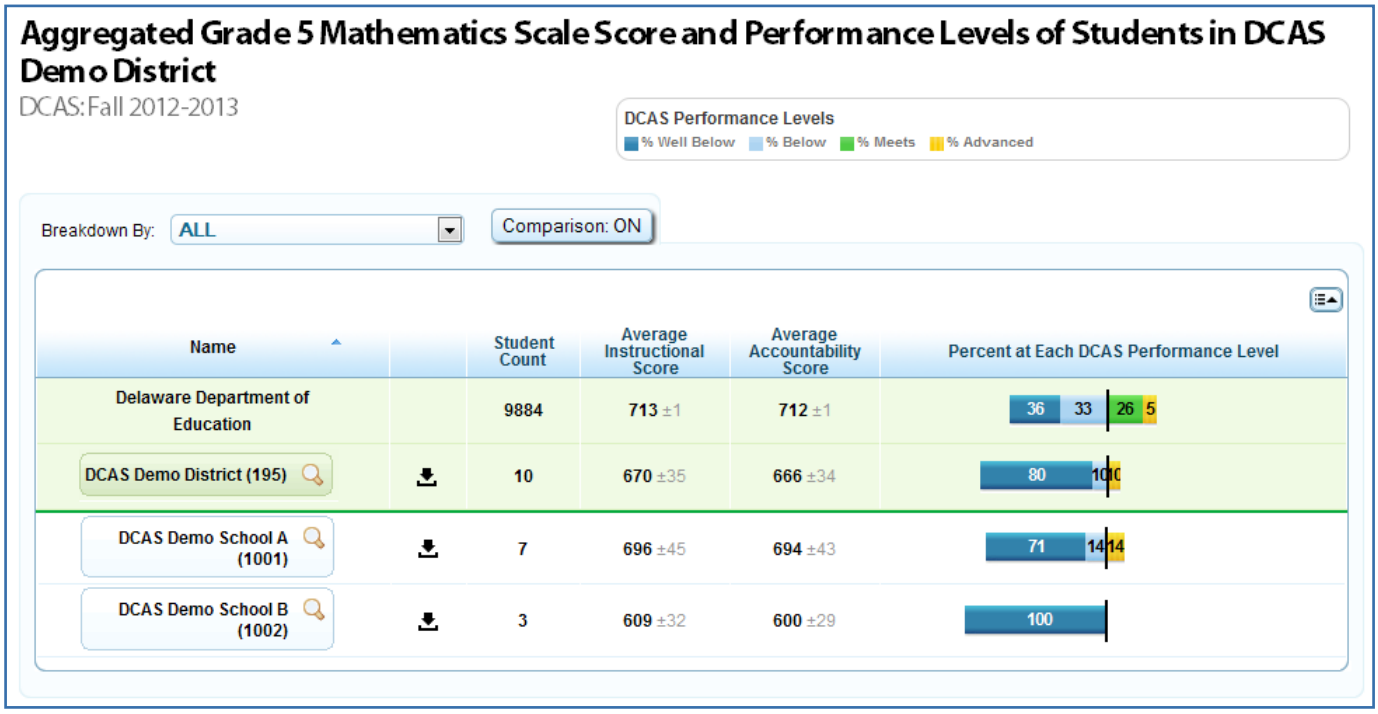
Table 5–2. Score Reports Dimensions

Dimension	Description	Categories/Reports
Who	Lets you see the data for institutions and groups (district-level, school-level, teacher-level, roster-level, and individual students).	View Institution View Personnel View Roster View Students
What	Lets you explore the data by reporting categories and benchmarks within the selected subject/content area.	View Subject View Reporting Categories View Benchmarks
When	Lets you see the data either as a "snapshot" of performance in the current test window or as a historical trend (for the subject/content area you are viewing).	View Trend View Testing Window

Navigating between Score Reports and Dimensions

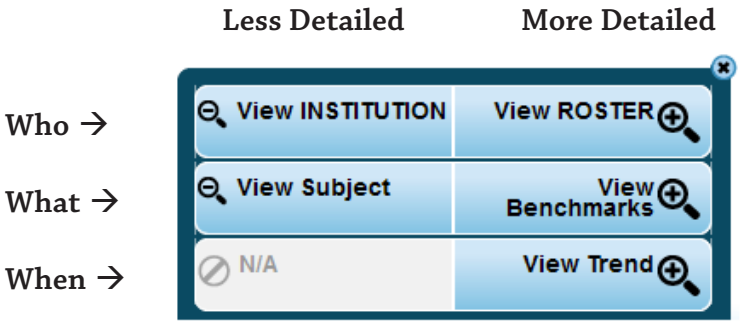
To navigate up or down a level or change to a different report type, simply click the magnifying glass icon [] next to an entity in the Name column. This action will bring up the Exploration Menu.

Sample Report Screen for a Selected Test



Exploration Menu

The pop-up Exploration Menu will display the available reports and levels. To view the report you want to see, click an available cell.

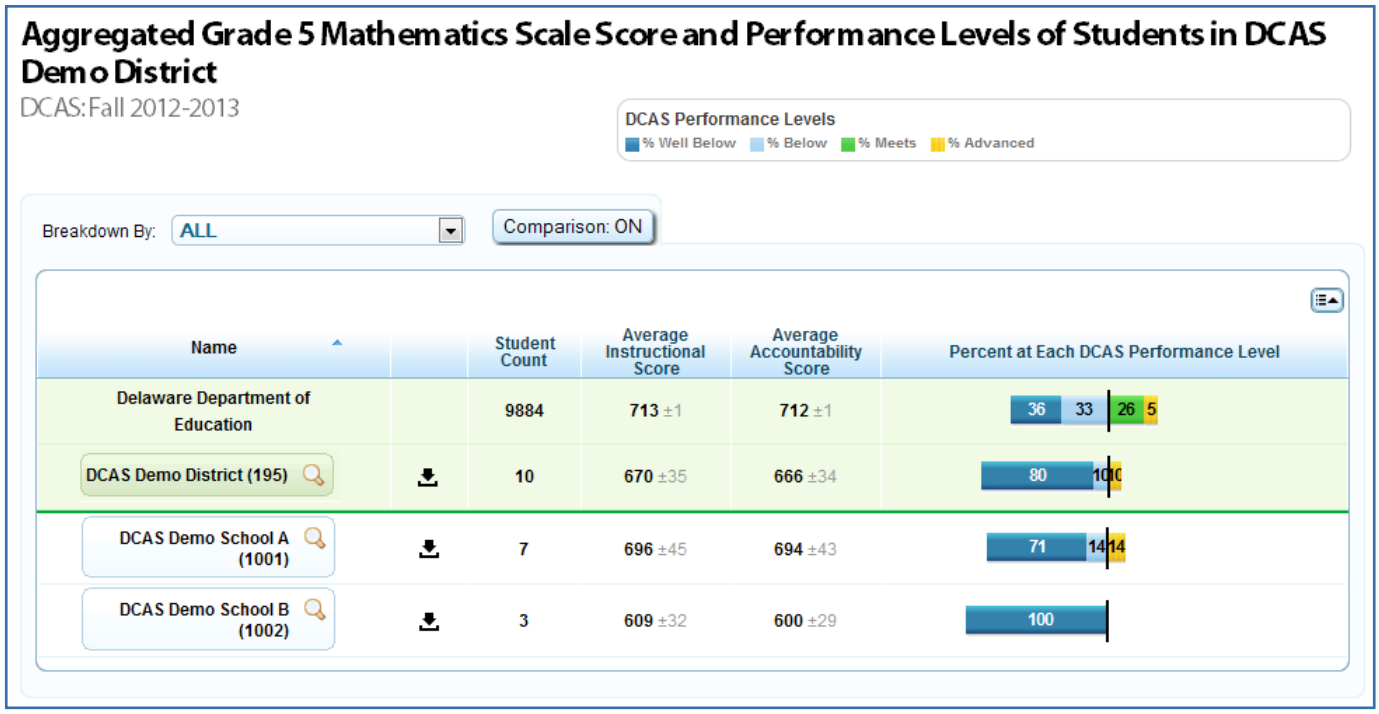


Important: Use the Exploration Menu to navigate back to the upper levels of the reports from the lower levels. Do not use your web browser's back button.

Score Reports Layout and Features

All score reports except individual student reports are in table format. Each column header is clickable; you can click any header to sort the data on the screen by that column. You can also show or hide columns in the table by clicking the arrow button [ ] in the top right corner of the table and selecting the columns you want to include or hide.

Sample Report Screen for a Selected Test



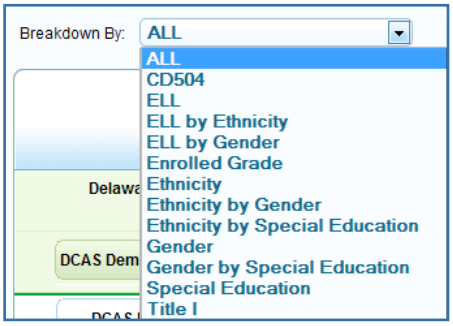
Note: At the bottom of every report is a time stamp that indicates when the report was generated.

At the top of each report are two options for analyzing the report you are viewing:

- Breakdown By
- Comparison

Breakdown By Demographic Subgroup

The "Breakdown By" filter allows you to disaggregate the performance data by a specific AYP category or a cross-section of two subgroups.



Selecting a filter will expand the on-screen report to display the data for each subgroup. For example, selecting "Gender" will display the associated performance data for male and female students. You can also select cross-sections of groups, such as Ethnicity by Gender.

Table 5–3. Demographic Subgroups

CD504	ELL	Ethnicity	Gender	Special Education	Title 1
CD504 Not CD504	ELL Not ELL	African American American Indian/Alaskan Native Asian/Pacific Islander Hispanic Multi-Racial White	Male Female	Special Education Not Special Education	Title I Not Title I

Breakdown By Test Event

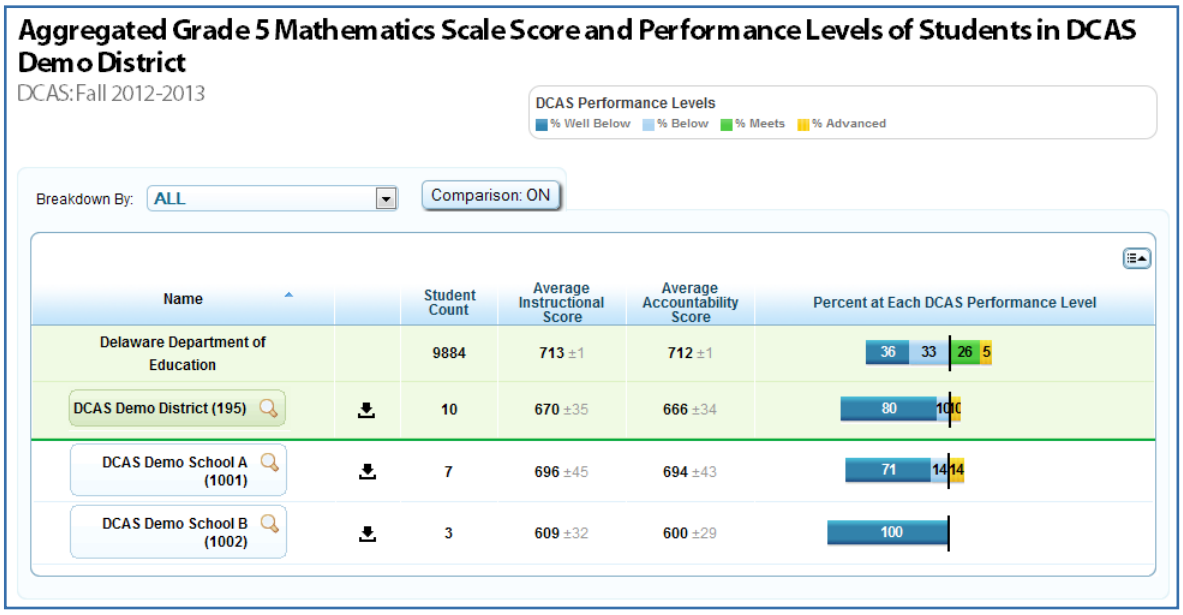
Similar to the breakdown by demographic subgroup filter, the "Test Event" filter allows you to disaggregate the performance data by a specific test accommodation. This feature is available starting from the current test year.

Selecting an accommodation (e.g., Language), will expand the on-screen report to display the data for each category (e.g., if you selected Language, then the report will display All, English, or Spanish).

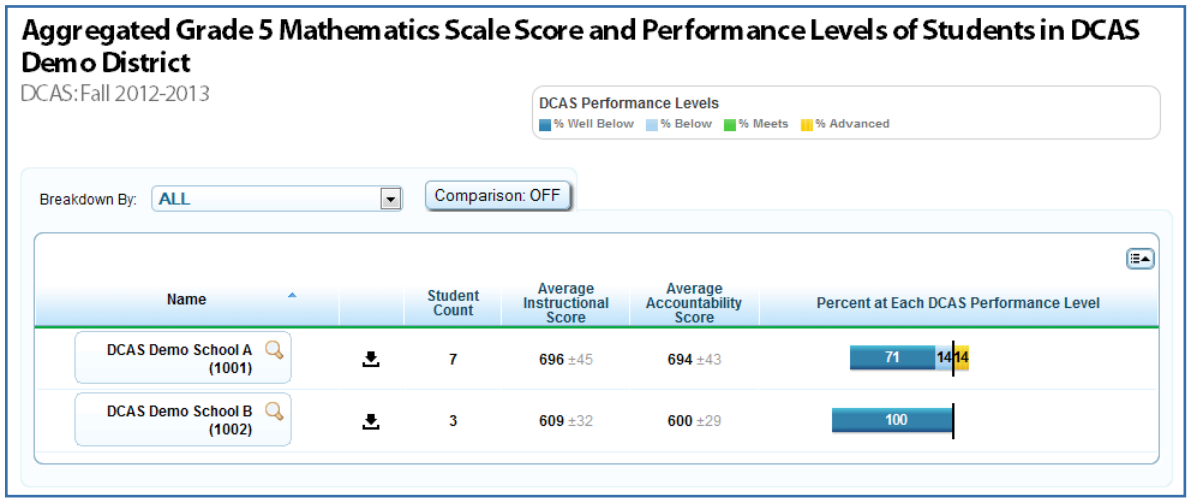
Comparison (On/Off)

This feature allows you to show or hide the overall score data of the state, district, and/or school that appears in the top rows (above the green bar). The **Comparison: On** status will display these rows. The **Comparison: Off** status will hide these rows. Simply click the [**Comparison**] button to change the setting.

Comparison: On



Comparison: Off



Download Student Data File

This feature allows you to download a data file of students who are included in the selected entity (aggregate group). For example, if you click the download icon [⬇] for a school, the data file will include all students associated with the school, their demographic information, their testing status, and performance data for scored tests. When your file is saved, go to the Inbox to access it. *See the Retrieve Student Results section in this user guide for information on downloading and viewing data files.*

Score Reports Legends

The legend at the top of each report page provides you with the color code that corresponds to each DCAS performance level. Refer to these legends to ensure that you understand the visual data presented.

Sample Legend – DCAS

Sample Legend – DCAS – Alt1

Notes:

- The legends vary between assessments and report types; e.g., Norm-Referenced/TerraNova tests will show national quartiles instead of performance levels.
- Legends do not appear on student-level report pages.

% Completed Column for DCAS Spring Tests

This column will display the percentage of students who have completed opportunities for the selected test during the spring testing window. This column is displayed only for DCAS spring Reading and Mathematics tests because students may have up to two opportunities for each test. This column is not displayed for tests that have only one opportunity in the testing window.

% Completed		
0	1	2
2	35	63
92	6	2
84	11	5

Reminder:

- *For the DCAS fall administration, students have only one test opportunity for each DCAS test. (This also applies to the DCAS winter administration, which was available before the 2012-2013 school year.)*
- *Students have one opportunity each for DCAS – Alt1 and EOC tests, in the Spring test window.*

Reports in the "Who" Dimension: Subject Detail Reports

Aggregated [Grade] [Subject] Scale Score and Performance Levels of Students in [Group]

Note about header: This is the actual name of the report that displays on screen; the bracketed text indicates a variable.

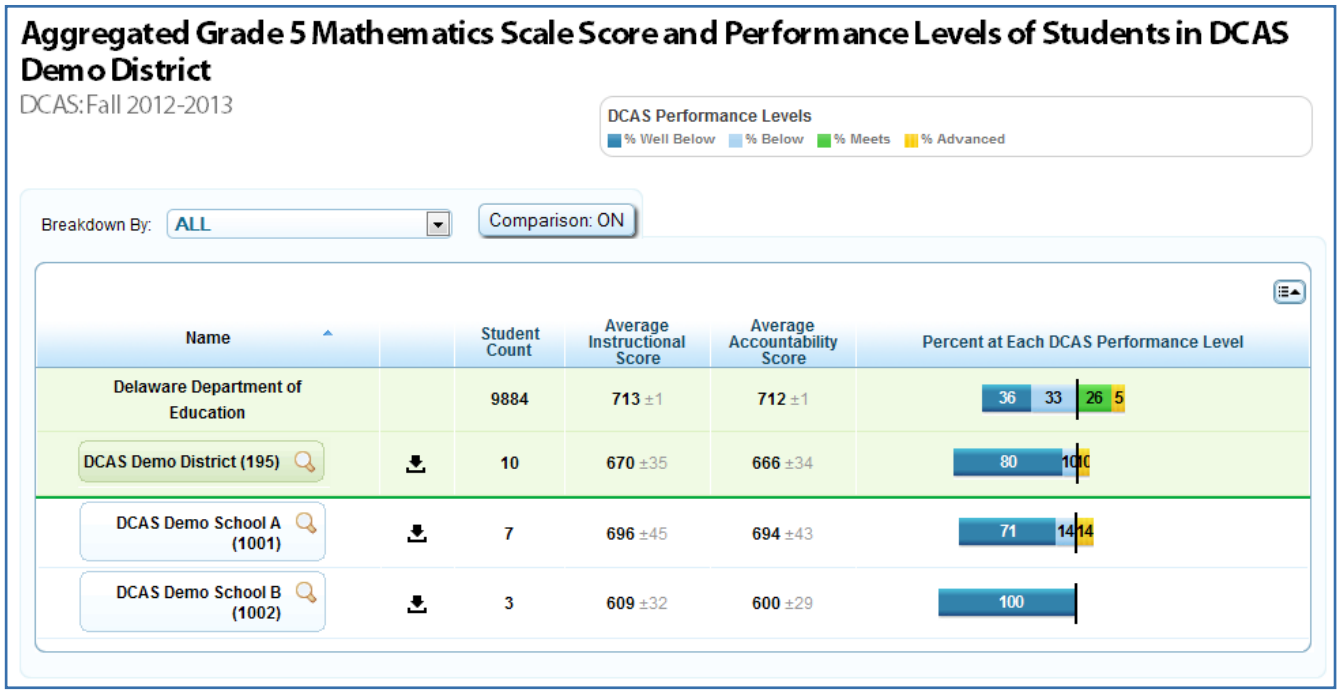
These **Subject** Detail Reports display overall student performance for the selected test. All data are based on the total number of students who have taken and completed the test and submitted it for scoring. This report contains the data shown in Table 5–4.

Table 5–4. Subject Report Column Descriptions

Column	Description
Name	The name of the entity/individual you are viewing (e.g., district, school, teacher/personnel, roster, student).
Download Data File	This feature allows you to download test data for a single test window for a complete list of students that are assigned to an entity.
Student Count	The number of students to date who have submitted the selected test for scoring.
Average Instructional Score	The mean Instructional Score and standard error of the mean of students who have completed the selected test; this score includes both on-grade and cross-grade items on the test. *Note: This column is not displayed for EOC, DCAS – Alt1, Norm-Referenced/TerraNova, or DCAS Science and Social Studies tests.*
Average Accountability Score	The mean Accountability Score and standard error of the mean of students who have completed the selected test; this score includes only on-grade items on the test.
Percent (%) at Each DCAS Performance Level	The distribution of students across the DCAS performance levels based on their Accountability Scores.
Estimated Percent (%) at Each DSTP Performance Level	Estimate of how your students would have placed in each of the DSTP performance levels based on their DCAS results. *Note: This column will only be displayed for DCAS Mathematics and Reading tests in the 2010–2011 reports.*
Percent (%) Completed	The overall percentage of students in the group (district, school, roster) who have completed the selected test and submitted it for scoring (spring testing window only). • This column is not displayed for DCAS – Alt1 or DCAS Science and Social Studies tests. • For the spring 2012 and 2013 DCAS administrations, this column will show two opportunities for Mathematics and Reading tests.
Average TerraNova Score	The mean TerraNova score and standard error of the mean of students who have completed the selected Norm-Referenced/TerraNova test(2010–2011 school year only).
Average NCE Score	The mean Normal Curve Equivalent (NCE) score and standard error of the mean of students who have completed the selected Norm-Referenced/TerraNova test(2010–2011 school year only).
Percent at Each National Quartile	The distribution of students in each of the four national quartiles based on their percentile ranks from the selected Norm-Referenced/TerraNova test (2010–2011 school year only).

Sample District-Level Report

This report is the default for state- and district-level users and shows data for the selected grade and subject. Authorized users can view the data for each school in the district.



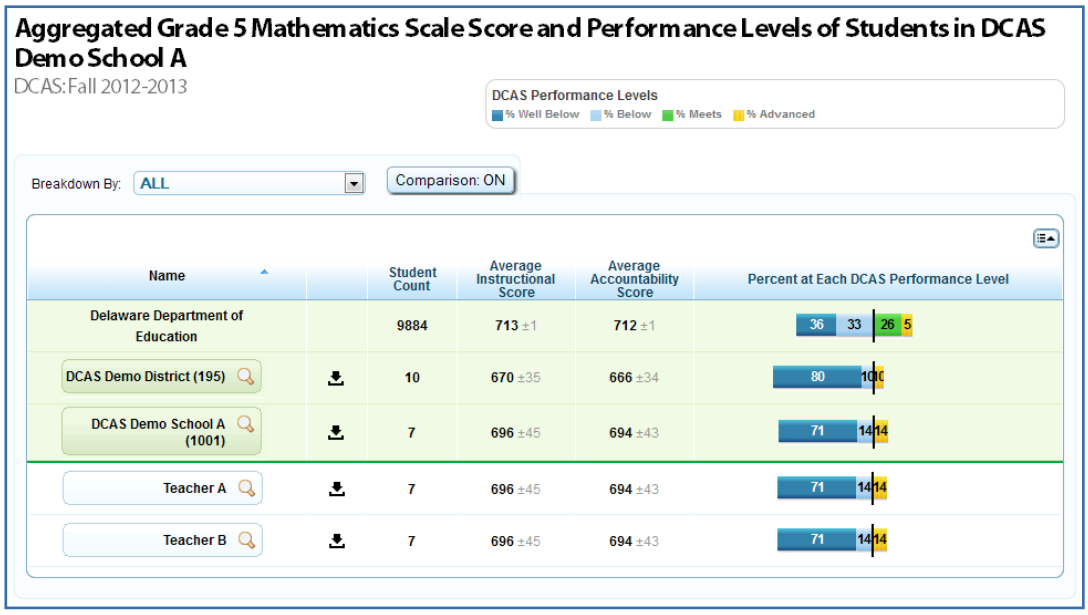
Exploring the Data

To explore the data further, click the magnifying glass [🔍] in any of the white rows to bring up the Exploration Menu. You can continue to lower levels of this report and view data at the **teacher** (personnel), **roster**, and **student** levels. You can also switch to the **Reporting Categories** report or the **Trend** report.

Reminder: Use the Exploration Menu to navigate back to the upper levels of the reports from the lower levels. Do not use your web browser's back button.

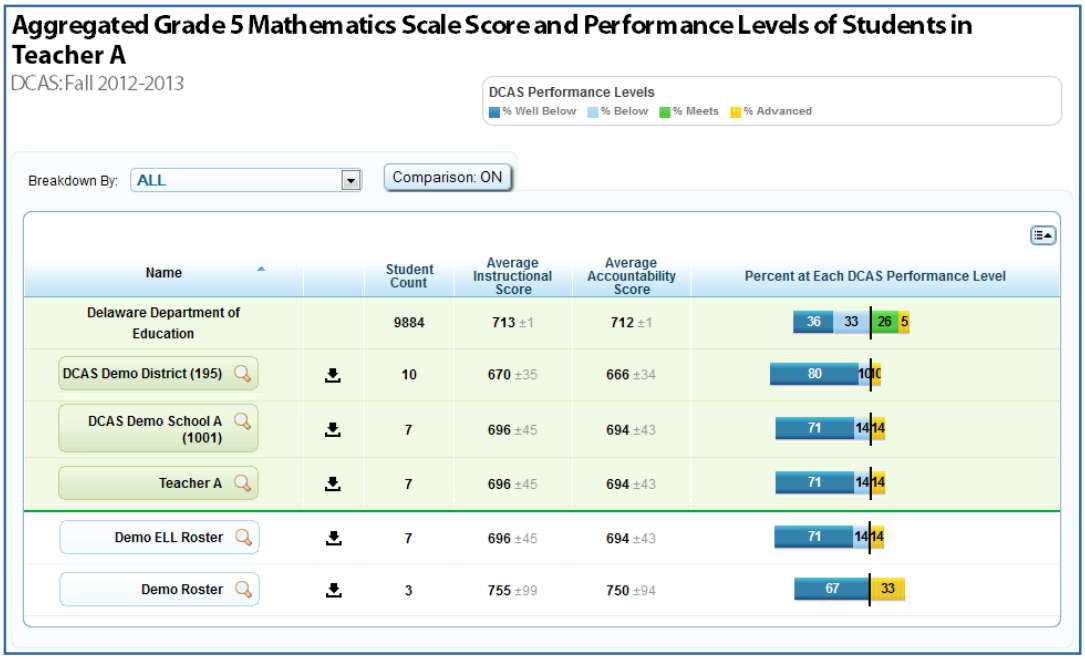
Sample Teacher-Level Report

To navigate to this report from the District-Level Report, click the magnifying glass icon next to a school name, and then click [**View Personnel**]. This report will display all the teachers in that school who have students who have completed the selected test.



Sample Roster-Level Report

To navigate to this report from the Personnel-Level Report, click the magnifying glass icon next to a teacher's name and then click [**View Roster**]. This report will display the teacher's rosters; these rosters include students who have completed the selected test.

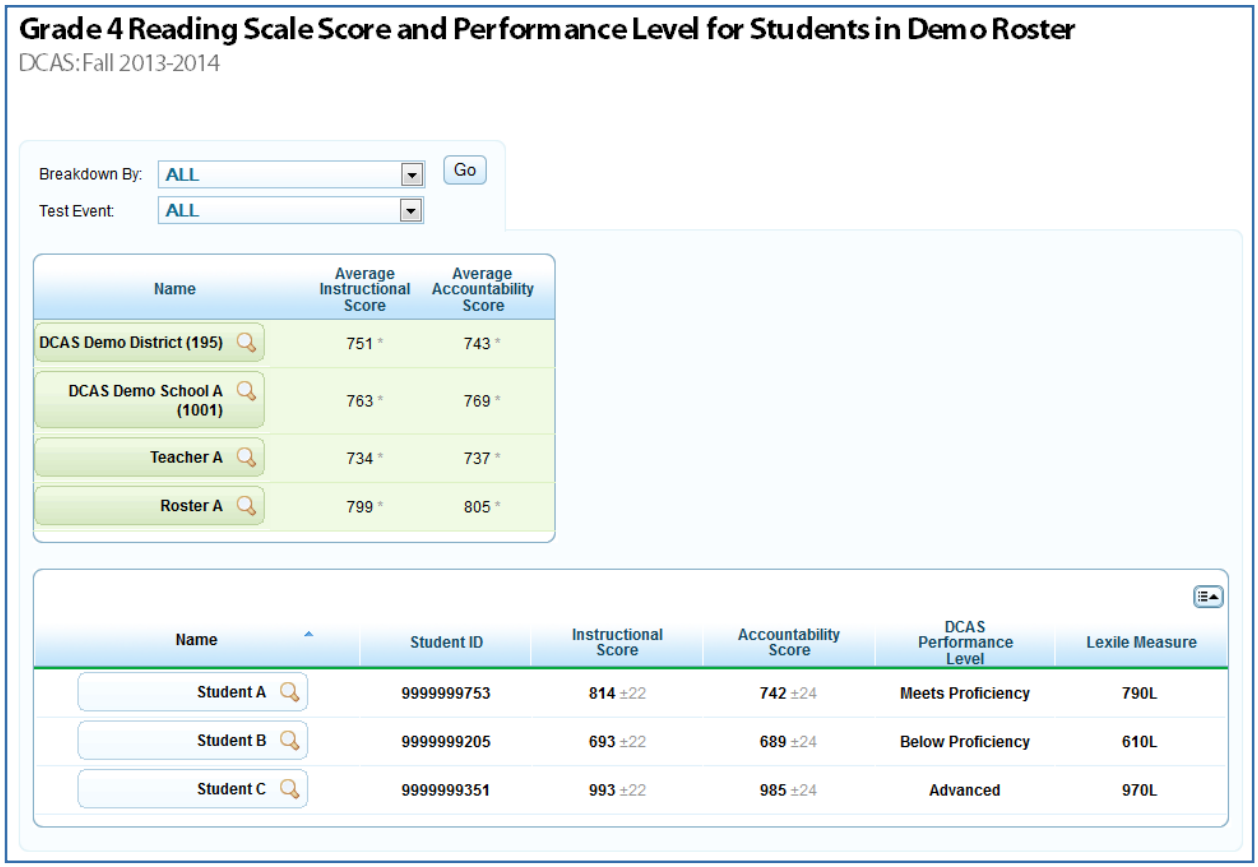


Hint: To see all the rosters in the school (above the green bar), click the magnifying glass next to the school's name and then click [**View Roster**].

Sample Student Listing Report

To navigate to this report from the Roster-Level Report, click the magnifying glass icon next to a roster name and then click [**View Student**]. This report will display all the students in the selected roster who have completed the test.

Note that you can see each student's scores as well as the average scores for the state, district, school, teacher, and roster.



For Reading assessments, a Lexile Measure column will display. A Lexile® measure represents a student's reading ability and can be used to guide the selection of books and other materials at an appropriate difficulty level. For additional information, visit Lexile.com.

Hint: To view all the students in a school or all the students associated with a teacher, click the magnifying glass next to the school or teacher's name (instead of clicking on a roster name), then click [**View Student**].

About the Student Listing Report

The Student Listing Report differs from the Subject Detail Reports in several key ways.

- The SSID is displayed.
- The scores are for individual students and are not mean scores (and the error band is the conditional standard error of measurement, not the standard error of the mean).
- To disaggregate students by subgroup with the "Breakdown By" feature, you must first choose a category from the Breakdown By drop-down list, then choose a specific subgroup from the Values drop-down menu and click [**Go**]. *The new list will only include students in the subgroup you selected.*

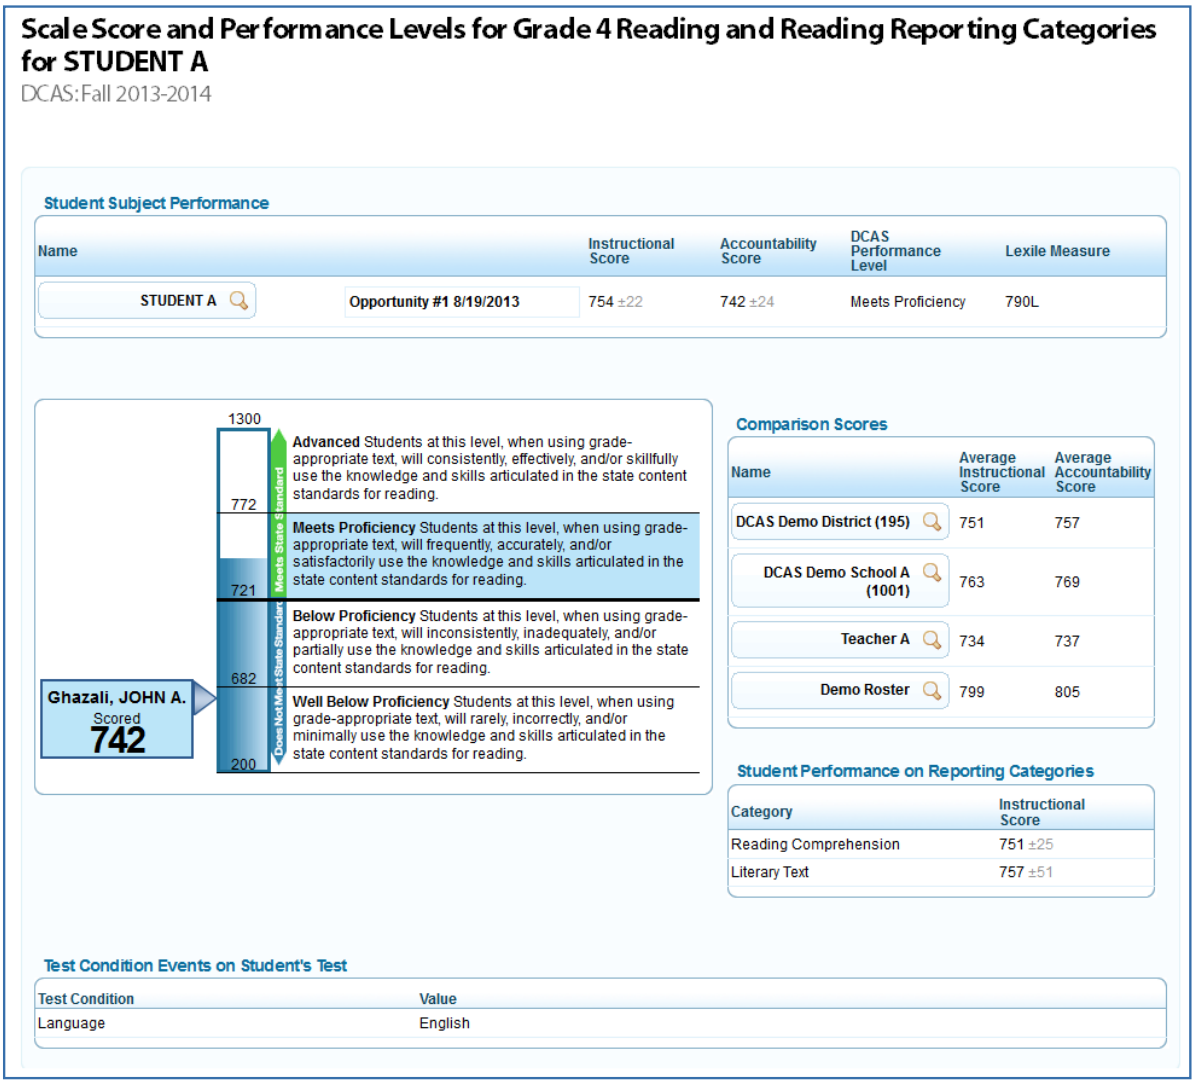
Reminder: All student data are confidential; if you export or print these student reports, ensure that they are kept in a secure place where others cannot access them.

Sample Individual Student Report

To navigate to this report from the Student Listing Report, click the magnifying glass icon next to a student's name and then click [**View Student**].

This report displays the breakdown of the student's score, the conditional standard error of measurement, and the Instructional Scores for each reporting category as well as performance-level descriptions for the selected grade and subject. ***Reminder: Student score data in this system are preliminary and not official.***

If you look at the Student Subject Performance box, you can see that the student's Instructional Score is 754 with an SEM of 24, and that the student's Accountability Score is 742 with an SEM of 25. Now compare these to the scores listed in the "Comparison Scores" box on the right side of the page. You can see that this student's scores are lower than the average Instructional and Accountability Scores for the roster and school, but higher than the average scores earned by the teacher's students. This student's scores are also similar to scores earned by students in the district and state. ***(Reminder: Average scores are compiled from the scores of those students who have taken the same test to date; averaged computations do not include those students who have not taken or completed the test.)***



Scale Score and Performance Levels for Grade 4 Reading and Reading Reporting Categories for STUDENT A

DCAS: Fall 2013-2014

Student Subject Performance

Name		Instructional Score	Accountability Score	DCAS Performance Level	Lexile Measure
STUDENT A	Opportunity #1 8/19/2013	754 ±22	742 ±24	Meets Proficiency	790L

1300

772

721

682

200

Meets State Standard

Does Not Meet State Standard

Advanced Students at this level, when using grade-appropriate text, will consistently, effectively, and/or skillfully use the knowledge and skills articulated in the state content standards for reading.

Meets Proficiency Students at this level, when using grade-appropriate text, will frequently, accurately, and/or satisfactorily use the knowledge and skills articulated in the state content standards for reading.

Below Proficiency Students at this level, when using grade-appropriate text, will inconsistently, inadequately, and/or partially use the knowledge and skills articulated in the state content standards for reading.

Well Below Proficiency Students at this level, when using grade-appropriate text, will rarely, incorrectly, and/or minimally use the knowledge and skills articulated in the state content standards for reading.

Ghazali, JOHN A. Scored 742

Comparison Scores

Name	Average Instructional Score	Average Accountability Score
DCAS Demo District (195)	751	757
DCAS Demo School A (1001)	763	769
Teacher A	734	737
Demo Roster	799	805

Student Performance on Reporting Categories

Category	Instructional Score
Reading Comprehension	751 ±25
Literary Text	757 ±51

Test Condition Events on Student's Test

Test Condition	Value
Language	English

Reporting category data are not provided for the DCAS – Alt1 or Norm-Referenced/TerraNova tests. The "barrel chart" and performance-level descriptors are not provided for the Norm-Referenced/ TerraNova test because this assessment does not have any associated performance levels.

Reports in the "What" Dimension: Reporting Categories

Aggregated Scale Score and Performance Levels for [Grade] [Subject] Reporting Categories for Students in [Entity]

The **Reporting Categories** reports show the overall performance of your students in each of the reporting categories for the selected DCAS subject. (These reports are not available for the DCAS – Alt1 and Norm-Referenced/TerraNova tests.)

This report displays the number of students who have completed the test (Count) and the mean scale score and standard error of the mean of these students.

Exploring the Data

To explore the data further, click a magnifying glass in one of the white rows to bring up the Exploration Menu. You can continue to lower levels of the Subject Detail Report and view data at the teacher (personnel), roster, or student level. You can also switch to the **Benchmarks** report or the **Trend** report.

Sample Reporting Categories Report

This report is the default for state- and district-level users.

Aggregated Scale Score and Performance Levels for Grade 5 Mathematics Reporting Categories for Students in DCAS Demo District

DCAS: Fall 2012-2013

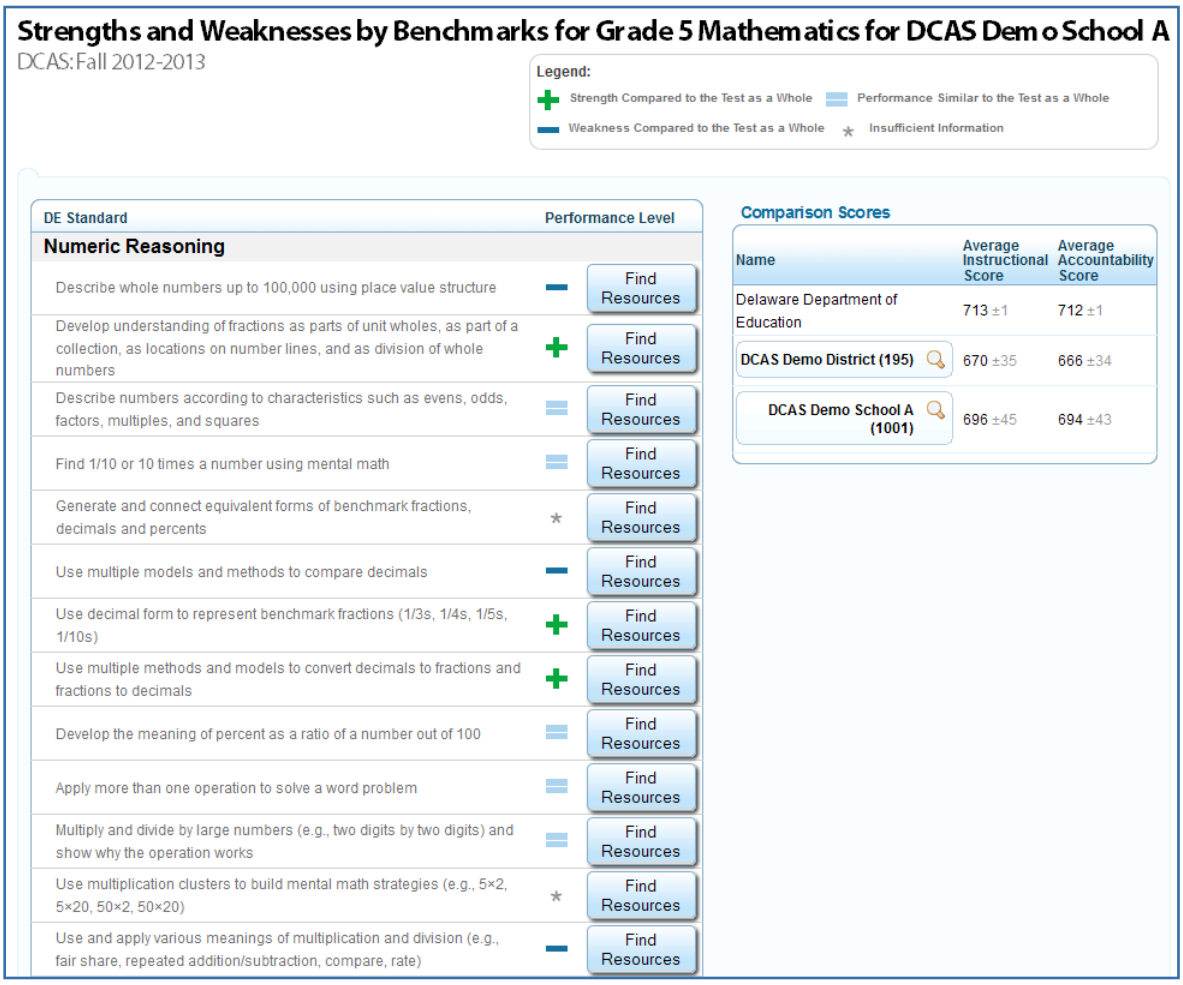
Breakdown By: ALL | Comparison: ON

Name	Student Count	Reporting Category	Average Instructional Score
Delaware Department of Education	9884	**Mathematics**	**713** ±1
		Numeric Reasoning	710 ±1
		Algebraic Reasoning	716 ±1
		Geometric Reasoning	713 ±1
		Quantitative Reasoning	715 ±1
DCAS Demo District (195)	10	**Mathematics**	**670** ±35
		Numeric Reasoning	670 ±35
		Algebraic Reasoning	645 ±42
		Geometric Reasoning	670 ±33
		Quantitative Reasoning	662 ±33
DCAS Demo School A (1001)	7	**Mathematics**	**696** ±45
		Numeric Reasoning	703 ±42
		Algebraic Reasoning	679 ±54
		Geometric Reasoning	682 ±48
		Quantitative Reasoning	673 ±45
DCAS Demo School B (1002)	3	**Mathematics**	**609** ±32
		Numeric Reasoning	593 ±42
		Algebraic Reasoning	566 ±45
		Geometric Reasoning	643 ±13
		Quantitative Reasoning	637 ±38

Sample Strengths and Weaknesses by Benchmarks Report

To navigate to this report from the main Reporting Categories page, click the magnifying glass icon next to a school name and then click [**View Benchmarks**]. This report will display all the benchmarks for each of the reporting categories in the selected DCAS test. The data shown in the Comparison Scores table are the average subject scores for the selected school.

Note: This report is not available for DCAS Grade 2 Mathematics and Reading, DCAS Social Studies, EOC, DCAS – Alt1, or Norm-Referenced/TerraNova tests.



Strengths and Weaknesses by Benchmarks for Grade 5 Mathematics for DCAS Demo School A

DCAS: Fall 2012-2013

Legend:
+ Strength Compared to the Test as a Whole
= Performance Similar to the Test as a Whole
− Weakness Compared to the Test as a Whole
* Insufficient Information

DE Standard	Performance Level	
Numeric Reasoning		
Describe whole numbers up to 100,000 using place value structure	−	Find Resources
Develop understanding of fractions as parts of unit wholes, as part of a collection, as locations on number lines, and as division of whole numbers	+	Find Resources
Describe numbers according to characteristics such as evens, odds, factors, multiples, and squares	=	Find Resources
Find 1/10 or 10 times a number using mental math	=	Find Resources
Generate and connect equivalent forms of benchmark fractions, decimals and percents	*	Find Resources
Use multiple models and methods to compare decimals	−	Find Resources
Use decimal form to represent benchmark fractions (1/3s, 1/4s, 1/5s, 1/10s)	+	Find Resources
Use multiple methods and models to convert decimals to fractions and fractions to decimals	+	Find Resources
Develop the meaning of percent as a ratio of a number out of 100	=	Find Resources
Apply more than one operation to solve a word problem	=	Find Resources
Multiply and divide by large numbers (e.g., two digits by two digits) and show why the operation works	=	Find Resources
Use multiplication clusters to build mental math strategies (e.g., 5×2, 5×20, 50×2, 50×20)	*	Find Resources
Use and apply various meanings of multiplication and division (e.g., fair share, repeated addition/subtraction, compare, rate)	−	Find Resources

Comparison Scores

Name	Average Instructional Score	Average Accountability Score
Delaware Department of Education	713 ±1	712 ±1
DCAS Demo District (195)	670 ±35	666 ±34
DCAS Demo School A (1001)	696 ±45	694 ±43

The performance levels indicated on this report are relative to the test as a whole. Unlike performance levels provided at the subject level, these strengths and weaknesses do not imply proficiency. Instead, they show how a group of students' performance is distributed across benchmark content relative to their overall subject performance.

For example, a group of students may have performed very well in a subject, but performed slightly lower in several benchmarks. Thus, the minus sign does not imply a lack of proficiency. Instead, it simply communicates that these students performed lower than expected given their higher performance across all of the other benchmarks put together. Though the students are doing well, an educator may want to focus on these areas.

Definitions for each performance level are described in Table 5–5. Refer to the *DCAS Subjects and Benchmarks* document on the Test Administration Resources page of the DCAS portal for a comprehensive list of all benchmarks by content (subject).

Table 5–5. Benchmark Level Legend Descriptions

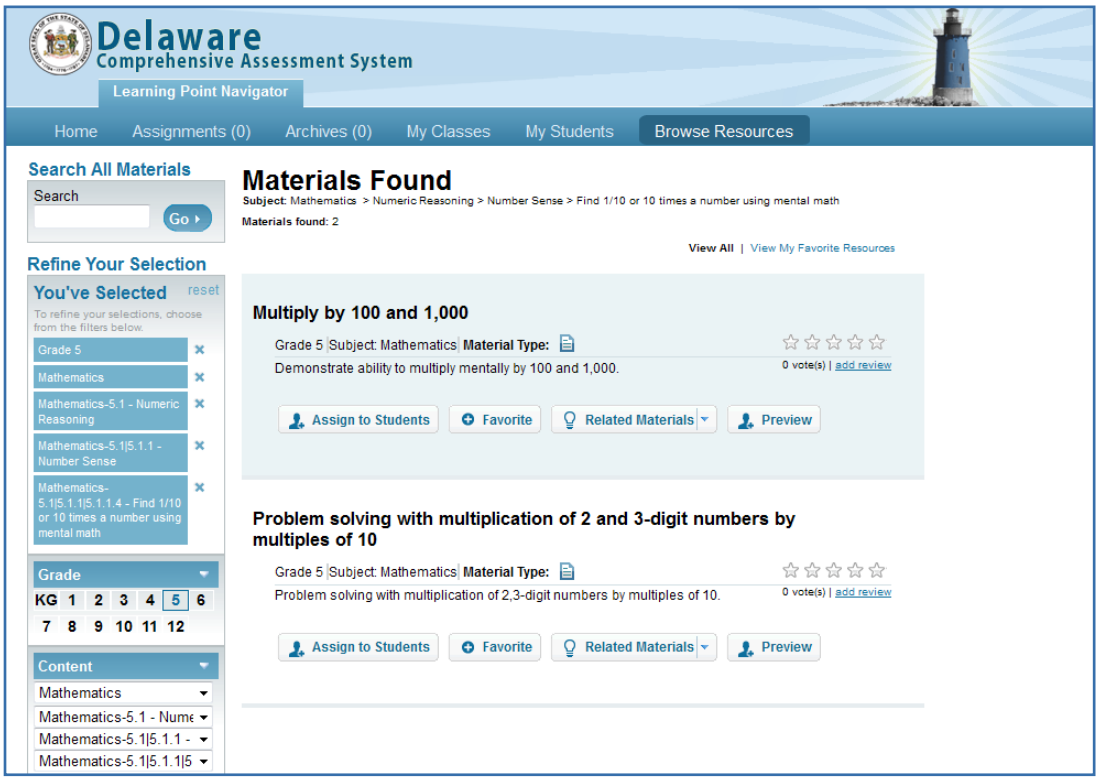
Benchmark Level		Description
+	**Strength compared to the test for the group selected**	This benchmark is a relative strength. The group of students performed better on items from this benchmark than they did on the rest of the test as a whole.
=	**Performance similar to the test for the group selected**	This benchmark is neither a relative strength nor a relative weakness. The group of students performed about as well on items from this benchmark as they did on the rest of the test as a whole.
–	**Weakness compared to the test for the group selected**	This topic is a relative weakness. The group of students did not perform as well on items from this benchmark as they did on the rest of the test as a whole.
*	**Insufficient information**	Not enough information is available to determine whether this benchmark is a relative strength or weakness.

In 2010–2011, this report was generated at the Topic level instead of the Benchmark level. There is no difference between Topics and Benchmarks in the DCAS Reading Reports; however, Benchmarks provide more detailed information than Topics for DCAS Mathematics and Science. In the 2011–2012 school year, Benchmark reports replaced the Topic-level reports.

Finding Resources in Learning Point Navigator

This Benchmark report also enables you to directly link to Mathematics, Reading, and Science resources for each content area benchmark in the Learning Point Navigator application. Click the [**Find Resources**] button for any benchmark to open a new browser window or tab. You will be automatically directed to the Browse Resources page. The associated resources for the topic you selected will be automatically displayed.

For information about using Learning Point Navigator and creating assignments using available resources, refer to the *Learning Point Navigator User Guide*.



Reports in the "When" Dimension: Trends

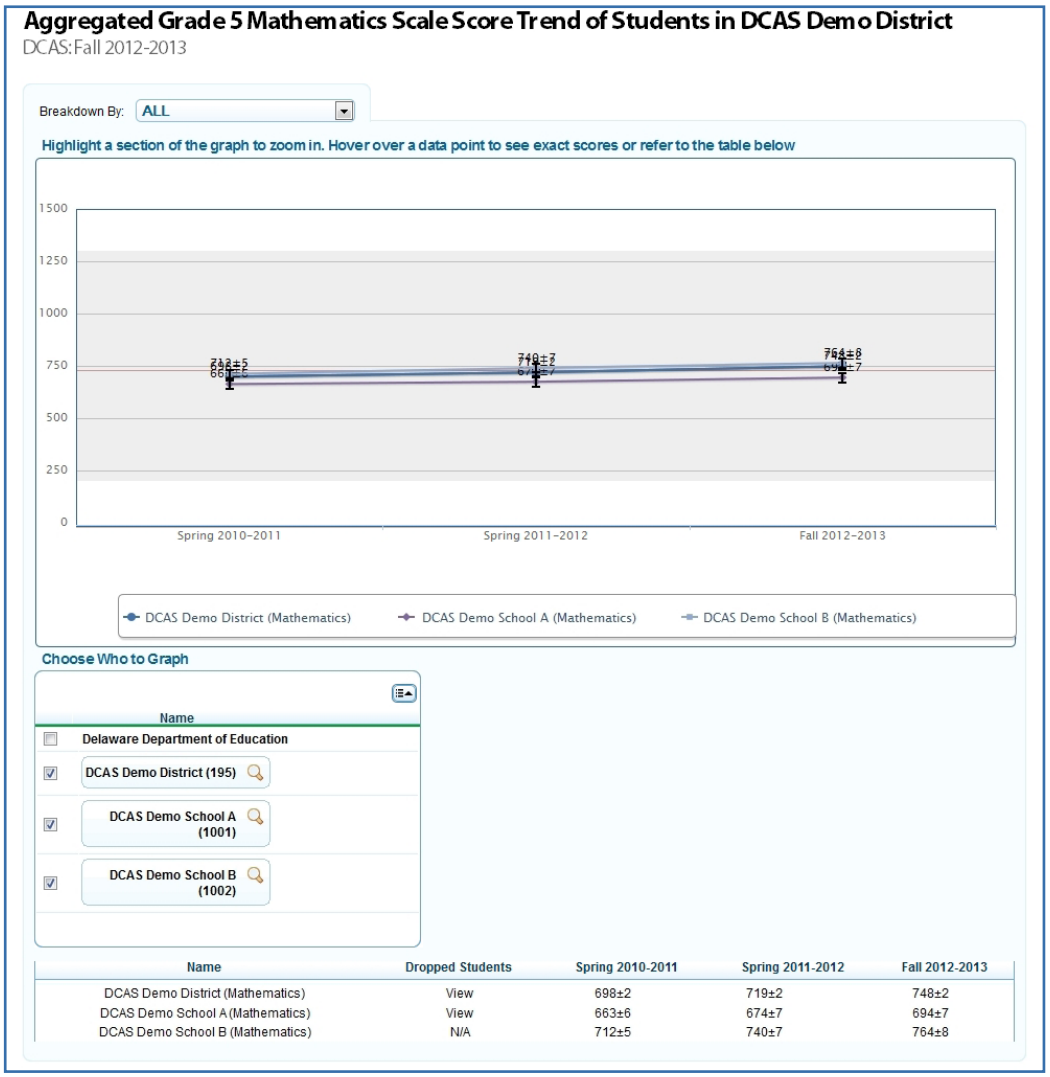
Aggregated [Grade] [Subject] Scale Score Trend of Students in [Entity]

The **Trend** reports show the overall performance of your students throughout the administrations for the selected test. The average scale score and associated standard error for each testing window is plotted. (For DCAS Mathematics and Reading, the Trend report is based on students' Instructional Scores.) The graph will automatically display the data available to you. Scores from previous years represent a group's average score or a student's individual score from that year's spring testing window.

Table 5–6. Access Level Descriptions

Access Level	Description
District	The "Choose Who to Graph" table will initially display the district and all schools in that district.
School/Teacher	The "Choose Who to Graph" table will initially display the district, school, and all personnel associated with the school.

Sample Trend Report



These trend reports are interactive. You can use "Choose Who to Graph" and "What to Graph" (if available) to plot specific data on the historical graph.

Choose Who to Graph
In this section, you may select up to five* entities. A trend line for each selected entity will appear on the graph and these will be color-coded.

** **Note: Due to space constraints, you can select no more than five trend lines to compare at one time.***

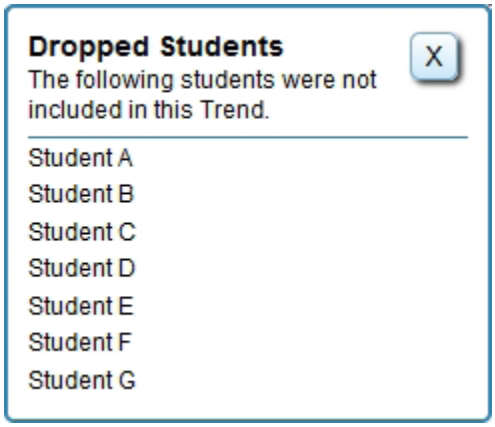
Viewing Data by Demographic Subgroup
As with the subject and reporting categories reports, you may also choose to plot data points by subgroup, e.g., gender. When a subgroup is selected, the "Choose Who to Graph" box will display the subgroup options for each entity. Select the combination entity and subgroup(s) that you want to plot.

Dimensions
Each entity listed in this box also displays the magnifying glass icon. You can elect to drill down and view trend data at the teacher (personnel), roster, or student levels.

What to Graph (by Subject or Reporting Category)
In this section, you may select the overall test subject data (default) or individual reporting categories to plot.
(Reminder: Reporting Categories are not available for DCAS – Alt1 tests.)

Dropped Students

All trend report pages include a column called "Dropped Students." If you see a [**View**] button in this column, this indicates students were not included in the trend report. If you see "N/A," this means that no students were dropped from the trend report.



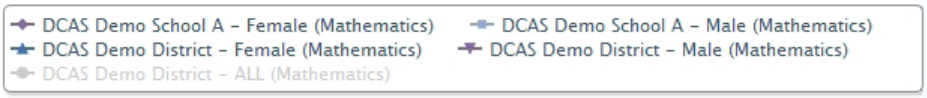
Students in the aggregate grouping are dropped from a trend report if they have not completed the selected test across all test windows. For example, a student who took Grade 5 Mathematics in the fall and winter test windows, but not the spring window, will be excluded from a trend report that includes all three testing windows.

Click the [**View**] button to see which students were not included. A pop-up window will appear showing the names of the students.

Why Students Are Dropped
When looking at data for a group of students over time, it is important to look at the same sample of students. If a student was not present for all testing windows displayed in your trend report, then that student will be omitted from the calculation of the mean scores. This helps to ensure that observed changes in mean scores are the result of actual differences in performance and not the result of the absence of a student during a testing window. Because of this, the average score on the trend report may not always match what you observe in the Subject Detail Report.

Hiding Trend Lines

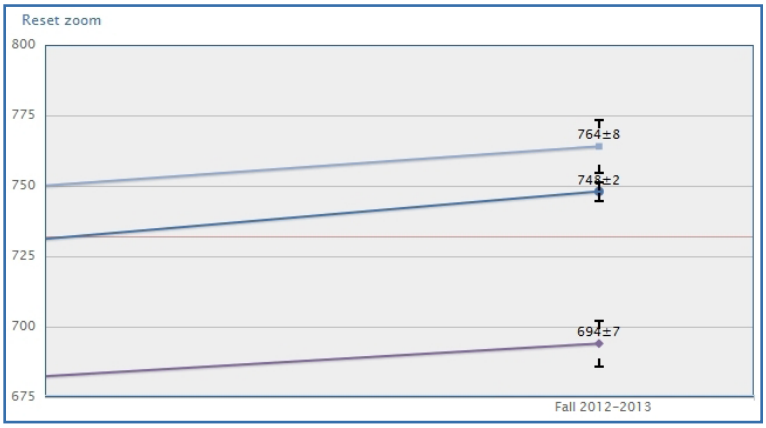
After you have plotted trend lines, you may want to temporarily "hide" a trend line to better view data. To do so, navigate to the box below the graph that contains the legend for the trend lines.



- Simply click the trend(s) you want to hide. The trend you have selected will become grayed out and the line will disappear from the graph.
- To display the trend line again, click the trend name again. The line will reappear on the graph.

Zoom Feature

Sometimes data points are plotted very close to one another, and it can be difficult to discern what points belong to which entity and/or reporting category. You can use your computer's mouse to zoom in on different areas of the graph.



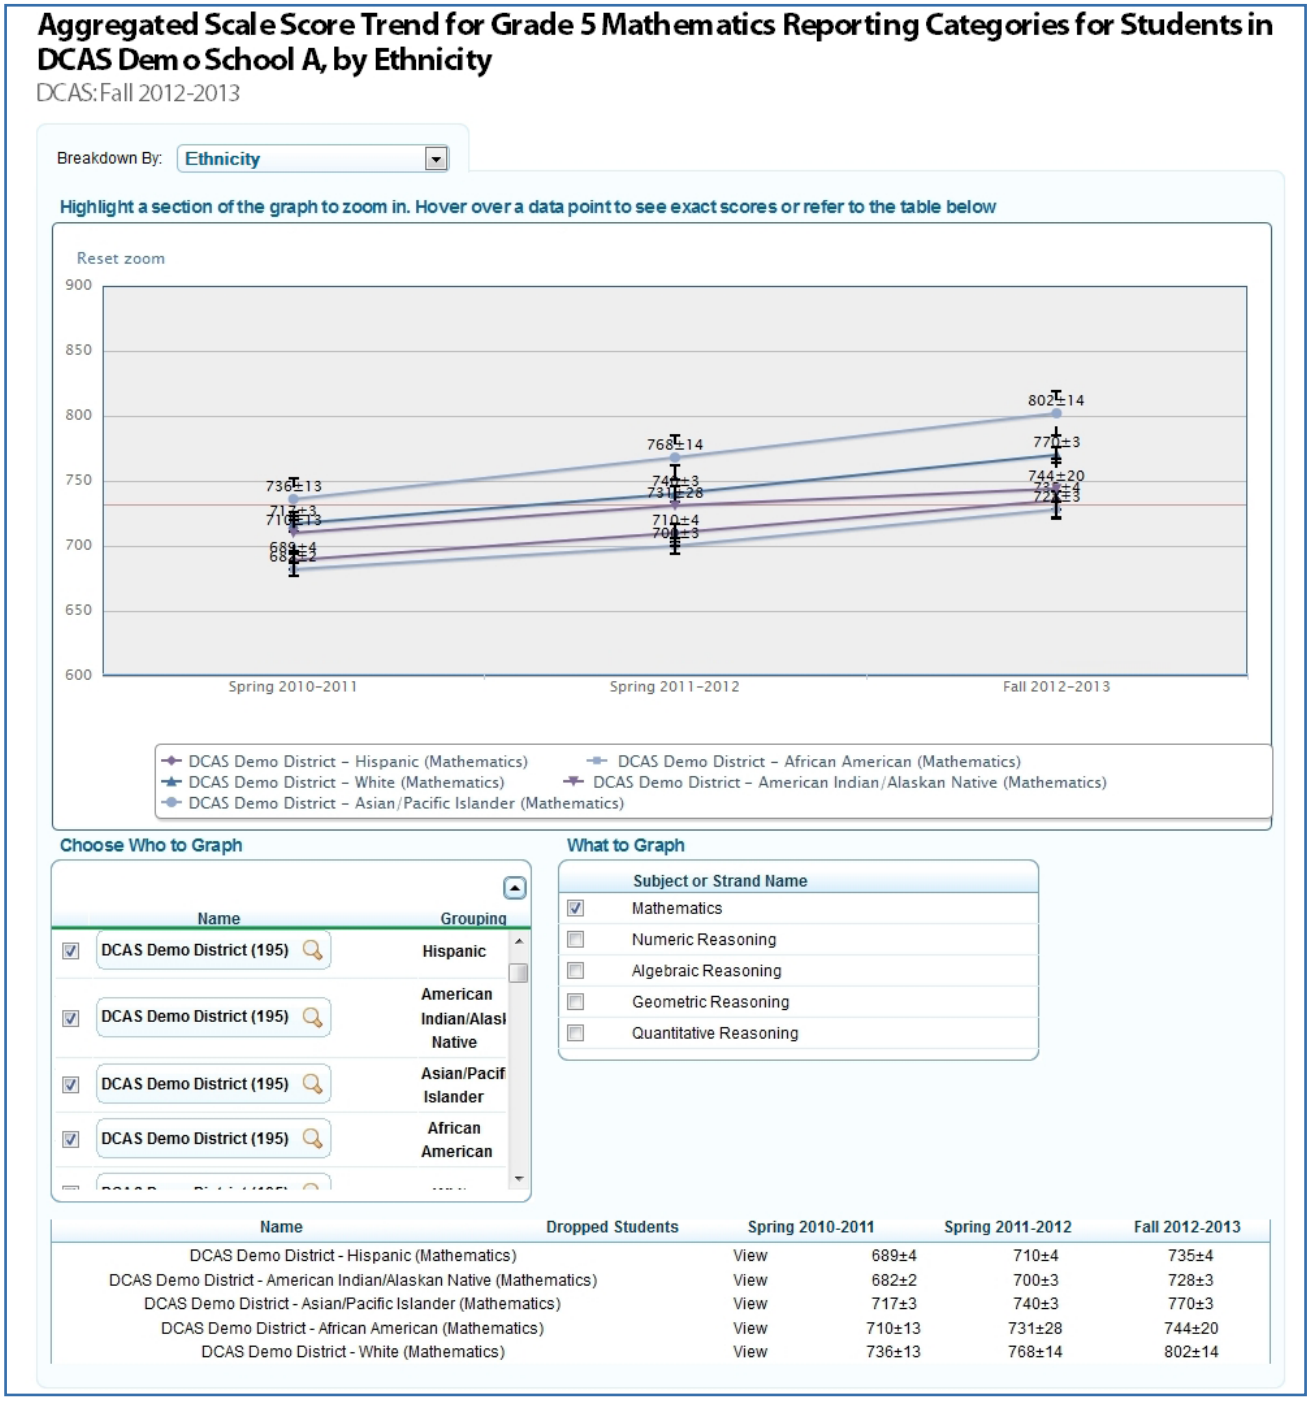
- To zoom in, click your mouse's left button and drag the mouse over an area of the graph that has at least one data point. You may repeat this action until you are satisfied with the view.
- To zoom out and return to the full trend graph, click the [**Reset zoom**] link at the upper left corner of the graph.

Sample District Trend Report (by Reporting Category and Subgroup Breakdown)

You can view trends by reporting category by clicking the magnifying glass icon next to the district, school, teacher, or class name and selecting [**View Reporting Categories**]. As with reports in the "Who" dimension, you can also filter trend reports by a selected subgroup or cross-section of two subgroups.

(Reminder: Reporting Categories are not available for DCAS – Alt1 tests.)

Sample District Trend Report by Reporting Category and Ethnicity



Name	Dropped Students	Spring 2010-2011	Spring 2011-2012	Fall 2012-2013
DCAS Demo District - Hispanic (Mathematics)	View	689±4	710±4	735±4
DCAS Demo District - American Indian/Alaskan Native (Mathematics)	View	682±2	700±3	728±3
DCAS Demo District - Asian/Pacific Islander (Mathematics)	View	717±3	740±3	770±3
DCAS Demo District - African American (Mathematics)	View	710±13	731±28	744±20
DCAS Demo District - White (Mathematics)	View	736±13	768±14	802±14

Sample Teacher Trend Report

To navigate to this report, click the magnifying glass icon next to a school name and then click [**View Personnel**]. The data shown are the average scale scores for the selected school.

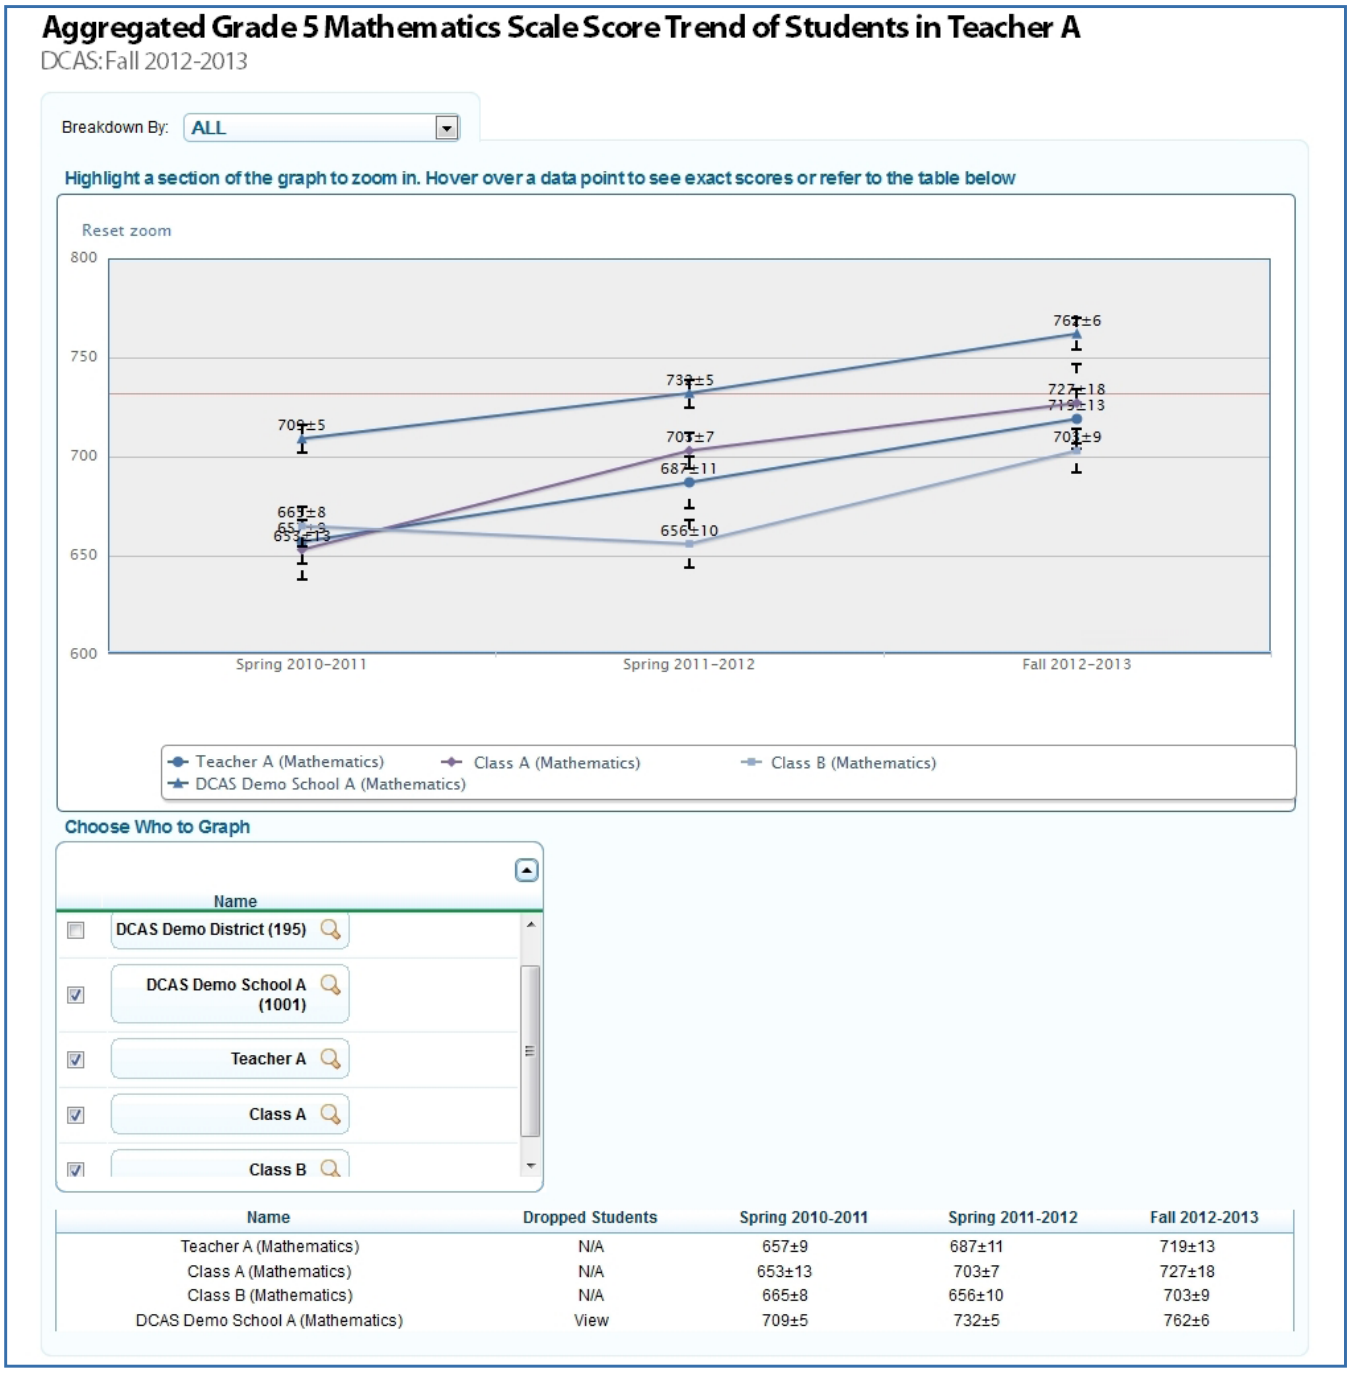
To plot trends for specific teachers, click the check box next to each teacher whose data points you want to view.

Name	Dropped Students	Spring 2010-2011	Spring 2011-2012	Fall 2012-2013
Teacher A (Mathematics)	N/A	657±9	687±11	719±13
Teacher B (Mathematics)	N/A	711±8	738±8	765±11
Teacher C (Mathematics)	N/A	716±9	738±10	778±12
Teacher D (Mathematics)	View	709±9	727±10	750±11
Teacher E (Mathematics)	N/A	716±10	738±10	780±12

Sample Roster Trend Report

To navigate to this report, click the magnifying glass icon next to a teacher's name and then click [**View Roster**]. The data shown are the average scale scores of all rosters for the selected teacher.

To plot trends for specific rosters, click the check box next to each roster for which you want to view data points.

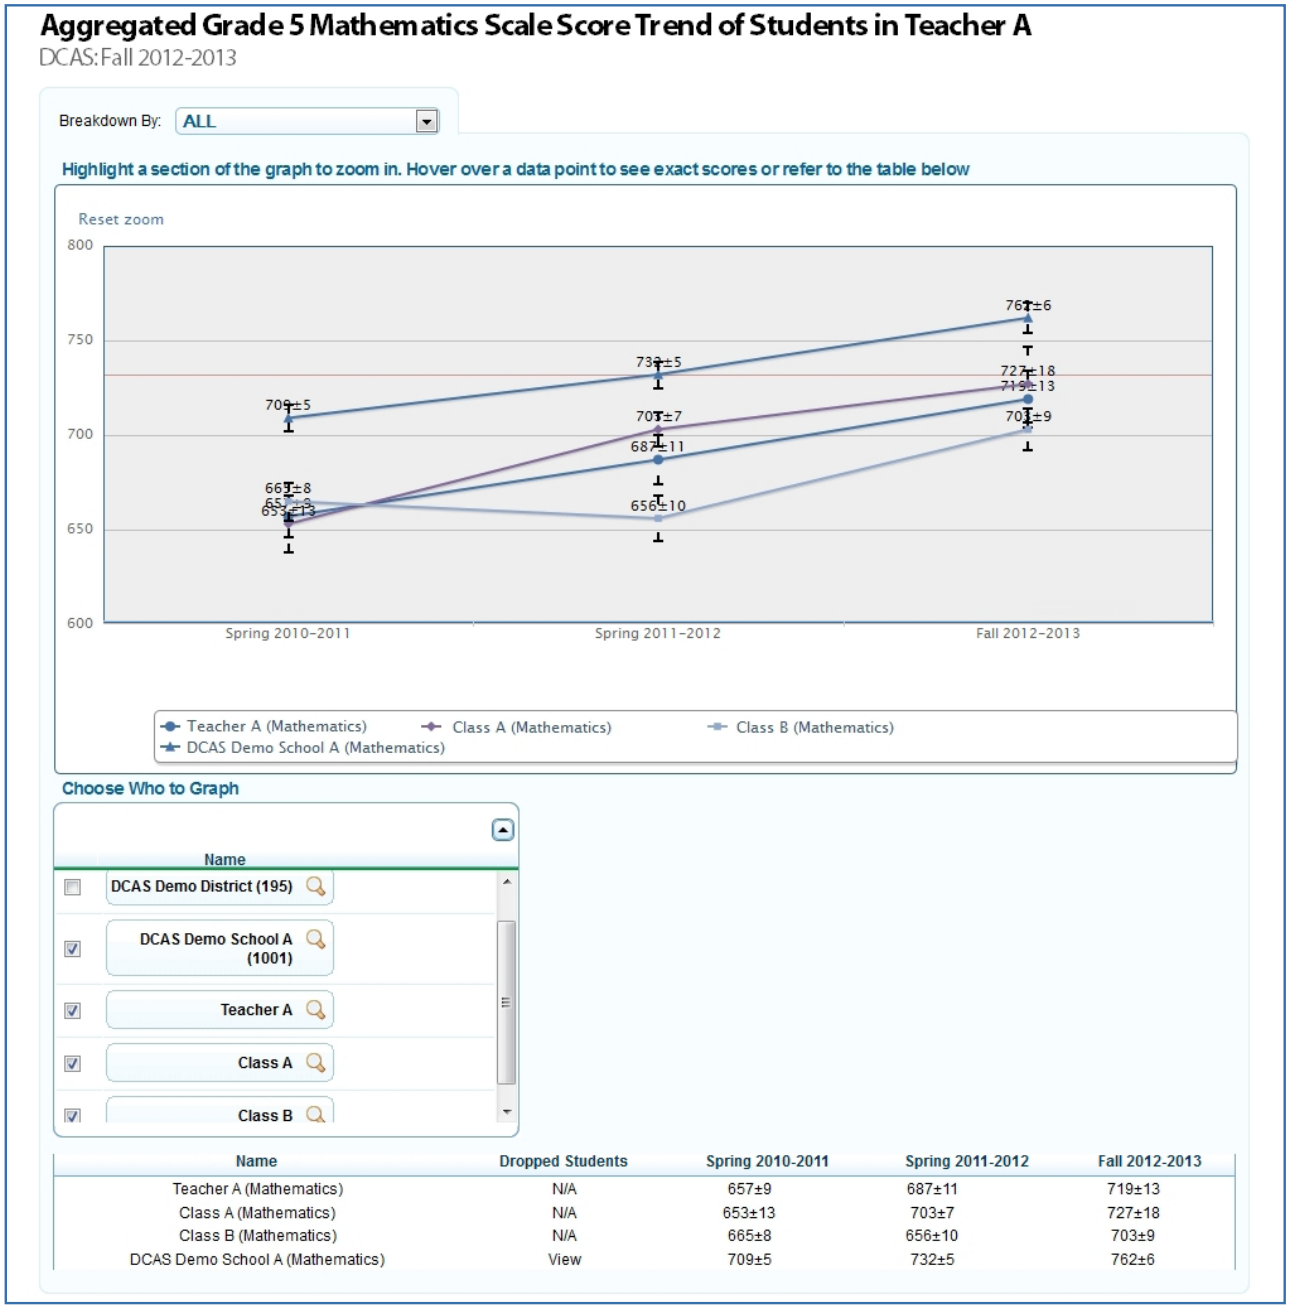


Name	Dropped Students	Spring 2010-2011	Spring 2011-2012	Fall 2012-2013
Teacher A (Mathematics)	N/A	657±9	687±11	719±13
Class A (Mathematics)	N/A	653±13	703±7	727±18
Class B (Mathematics)	N/A	665±8	656±10	703±9
DCAS Demo School A (Mathematics)	View	709±5	732±5	762±6

Sample Student Listing Trend Report

To navigate to this report, click the magnifying glass icon next to a class name and then click [**View Student**]. By default, the trend line displayed is for the first student shown at the top of the list in the "Choose Who to Graph" box.

To plot trends for specific students, click the check box next to each student whose data points you want to view. ***(Reminder: You cannot plot more than five trend lines at a time.)***

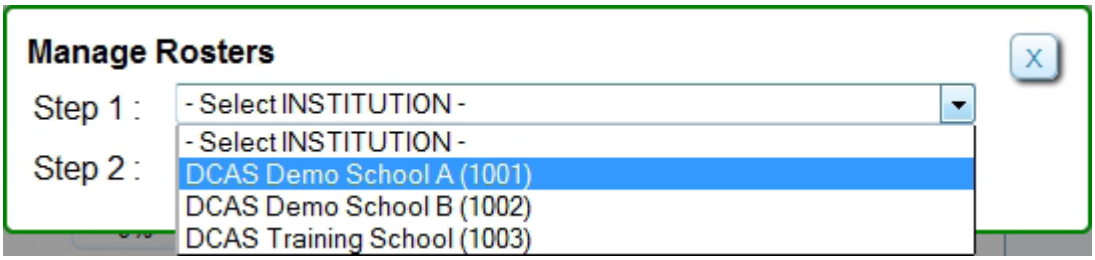


Section VI. Manage Rosters

The "Manage Rosters" section allows you to create custom groupings of students for which you can analyze aggregate data. This feature is accessible at all times except when the TIDE system is unavailable as a result of scheduled maintenance. Click [**Manage Rosters**] to create and edit rosters.

After you click the icon, a pop-up window will appear.

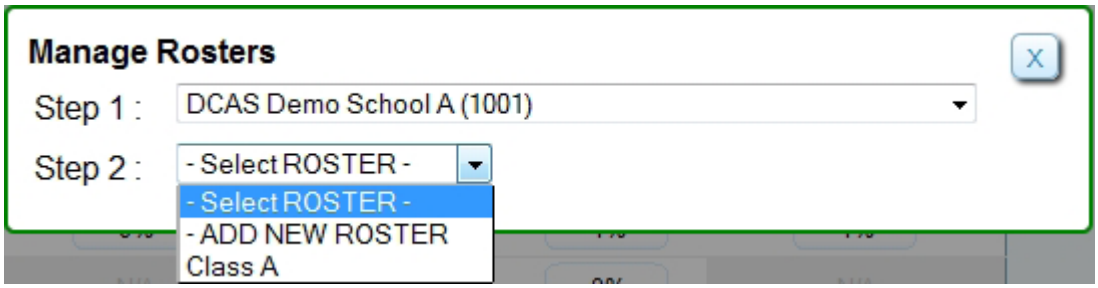
Manage Rosters—Step 1
State and district users will be able to select the institution. (For school and teacher log-ins, the institution will already be selected and grayed out.)



Manage Rosters—Step 2

1. In the drop-down menu, select either an existing roster or ADD NEW ROSTER to create a new roster.

2. When are you are done, click [**Next**].
   If selecting a roster to edit, this button may take some time to load.



Manage Rosters—Adding a New Roster

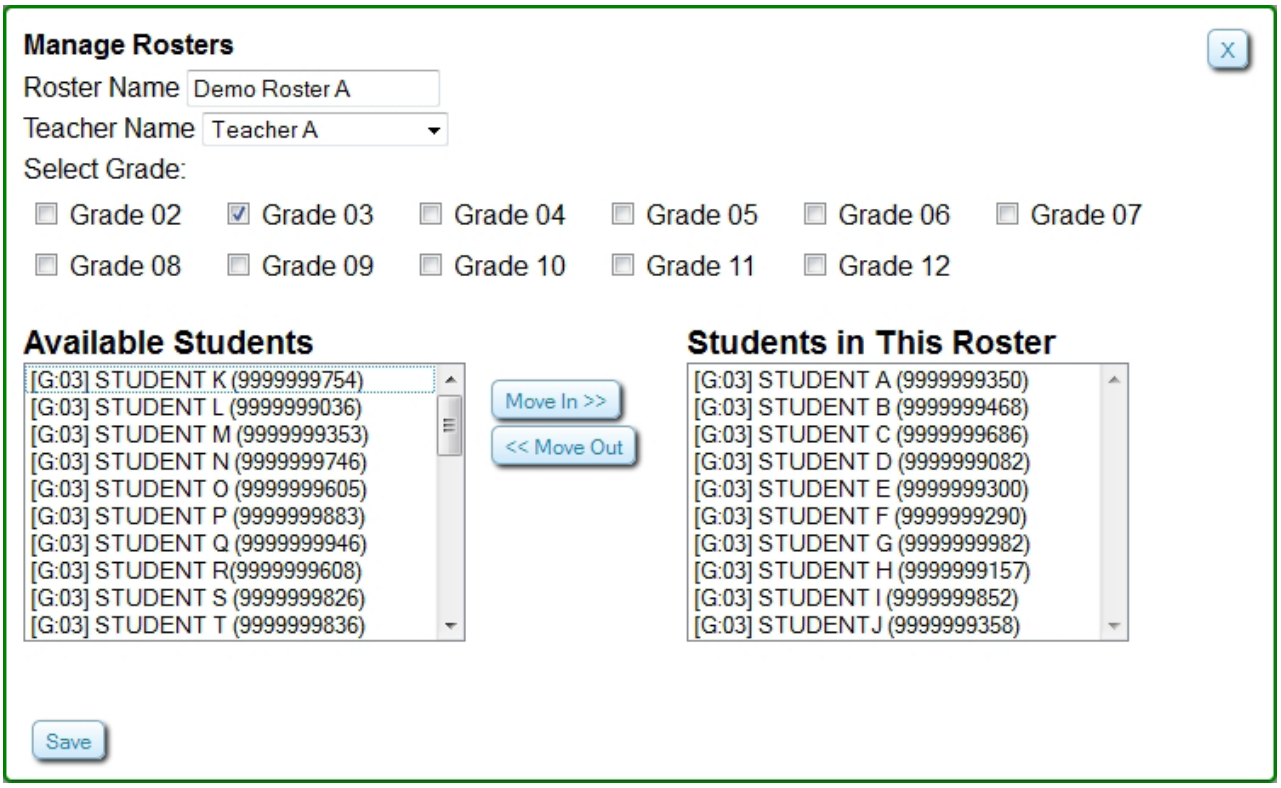
1. Enter a name for the roster. This roster name will appear in the Online Reporting System and in Learning Point Navigator. ***(Note: Roster names must have between five and 100 characters.)***

2. Select a teacher to associate with the roster. Be sure that you are selecting an "active" teacher (one with current DCAS credentials).
   - Teachers listed are those who have been identified as teacher users in DCAS and are associated with the selected school.

3. Select the grade level(s) of the students you want to include in this roster. The list of associated students in the school will populate the Available Students box.
   Reminder: The score reports display data only for a single subject and grade (not grade band) at one time. If a roster includes students from multiple grades, you will see only the roster-level data that correspond to the test subject and grade you selected on the Home page. (If a roster includes students from grades 3 and 4, and you select a Grade 3 Math test, you will see data only for the students who tested in grade 3.)

4. Select the students you want to include in the roster.
   - Press the [**Ctrl**] button on your keyboard to select multiple students at once.
   - Press the [**Shift**] button on your keyboard to select a range of students.

5. Click [**Move In >>**] to move the selected students into the Students in This Roster box.



6. When you are done, click [**Save**] to add the roster to the Online Reporting System. The Manage Rosters pop-up window will also close and you can return to the report page you were viewing.

Note: You may add students to multiple rosters.

Manage Rosters—Editing an Existing Roster

Please remember to edit or delete rosters that were created by district or school personnel. Do not edit rosters that were created by the Department.

The following fields are editable:

- Class Name
- Teacher Name (select another teacher to associate with the roster)

To remove students from the roster:
Note: This will NOT remove students from the Online Reporting System.

1. Select the students you want to remove in the roster.
   - Press the [**Ctrl**] button on your keyboard to select multiple students at once.
   - Press the [**Shift**] button on your keyboard to select a range of students.
2. Click [<< **Move Out**] to move the selected students into the Available Students box.

To add more students to the roster:

1. Select the grade level(s) of the students you want to include in this roster. The list of associated students in the school will populate the Available Students box.
2. Select the students you want to include in the roster.
   - Press the [**Ctrl**] button on your keyboard to select multiple students at once.
   - Press the [**Shift**] button on your keyboard to select a range of students.
3. Click [**Move In >>**] to move the selected students into the Students in This Roster box.

When you are done editing the roster's attributes and adding/removing students, click [**Save**].

Deleting a Roster:
Note: This action CANNOT BE UNDONE. Please take care when deleting rosters. (Please delete only district- or school-created rosters.)

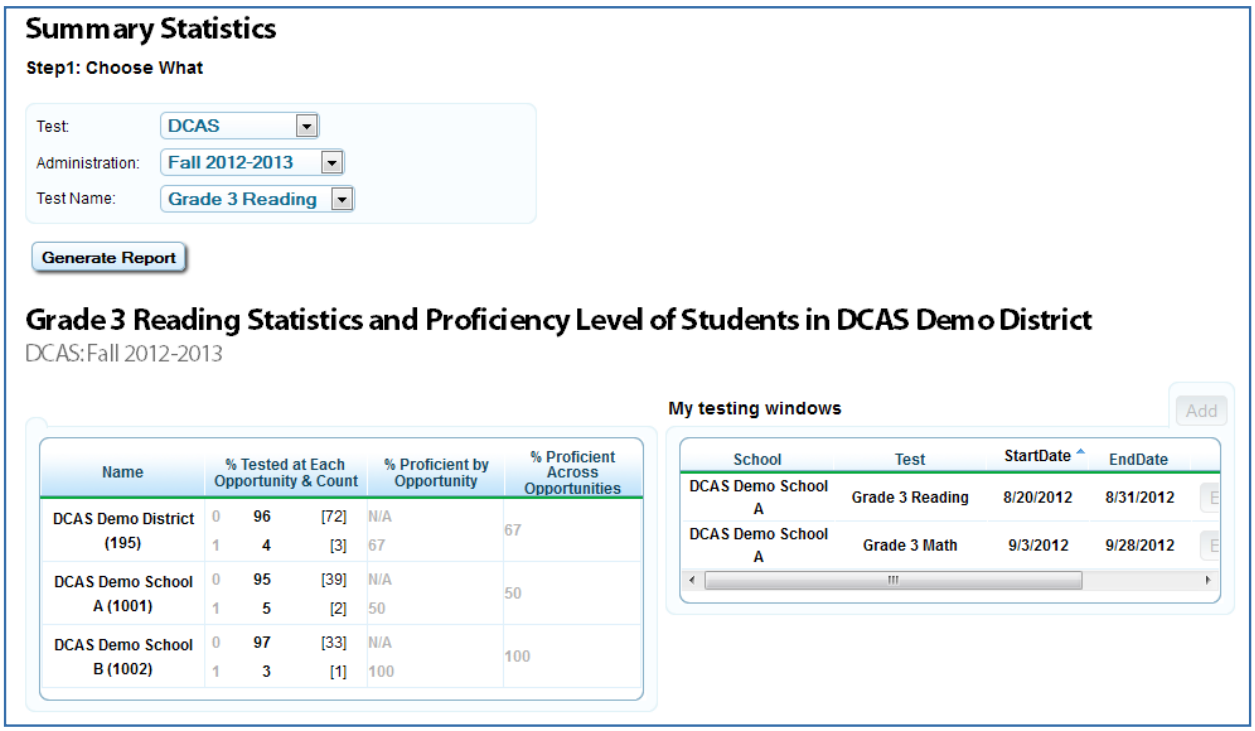
1. Follow the steps to open an existing roster.
2. Click the [**Delete**] button. A pop-up warning will appear, asking you to confirm that you want to take this action.
3. Click [**OK**] to continue and to remove the roster from the Online Reporting System (this will also remove the roster from Learning Point Navigator).

Section VII. Test Management Center

The Test Management Center allows authorized users to view summary statistics, retrieve student data, and generate customized reports showing students' activity in the online testing system. To access the Test Management Center, click the [**Test Management Center**] link, which is available at the top of any page.

Summary Statistics

The Summary Statistics section allows you to view the statistics for students who have tested at each opportunity for a selected assessment type (DCAS, EOC, or DCAS – Alt1), test window (fall, winter, or spring) and test (subject and grade or grade band).



From the drop-down lists, select the variables you want and then click [**Generate Report**].

Notes:

- *Summary statistics are not available for DCAS – Alt1-SR. However, the My Testing Windows feature is available for this test.*
- *Depending on the amount of data being processed, the table may take a few seconds or longer to populate.*

Table 7–1. Summary Statistics

Data Column	Description
% Tested at each opportunity and count **0 – the % of students whose tests have not yet reached "Reported" status. (This includes students who have not started the test opportunity.)** **1 – completed (reported) first opportunity** **2 – completed (reported) second opportunity** **[#] – Student count**	This column displays the total percent of students whose tests are in "reported" status for each opportunity in the test window. ***Reminder: For spring 2012 and 2013 DCAS tests, students have two opportunities each for Mathematics and Reading.*** The student count column shows the number of students who have completed each opportunity in brackets. The student count displayed for "0" opportunity is the number of students who have not yet started the first opportunity.
% Proficient by Opportunity	This column displays the percent of students who have met (or exceeded) proficiency in each opportunity for the selected test.
% Proficient across Opportunity	This column displays the total percent of students who have met (or exceeded) proficiency in any of the available opportunities in the testing window.

Beginning in the 2012–2013 school year, the values in the Summary Statistics table will be cumulative within a test window. For example, the percentage of students who have completed the first opportunity will include both the students who have only taken their first opportunity as well as those students who have taken the first opportunity and gone on to take a second opportunity. Similarly, the percentage of students proficient by opportunity will display the pass rate for all students who took the opportunity, regardless of whether they went on to take the second opportunity.

My Testing Windows

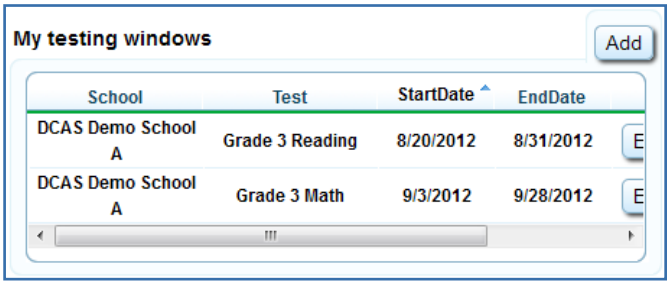
This feature is for school users to create, record, and manage planned testing windows in their school. These testing windows are independent of the actual DDOE testing windows. School users can use these to plan and manage testing schedules within the school.

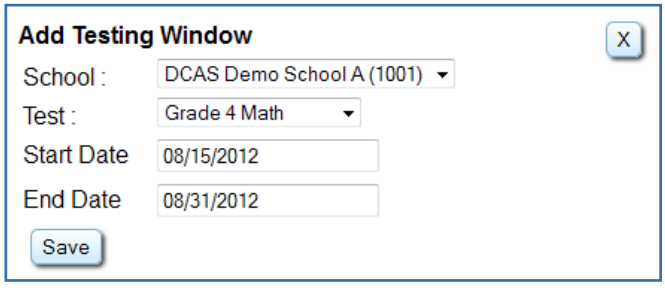
Authorized school users can add and edit testing windows.

- *Users in a school cannot view testing windows created in other schools, only those created within their school.*
- *District users can view testing windows that school users have created.*

To add a testing window:

1. Click the [**Add**] button. A pop-up window will appear.
2. Select the school and test from the drop-down lists.
3. Click in the **Start Date** and **End Date** fields to bring up a calendar. Select the start and end dates for the testing window.
4. Click [**Save**]. The information will appear in the "My Testing Windows" box.



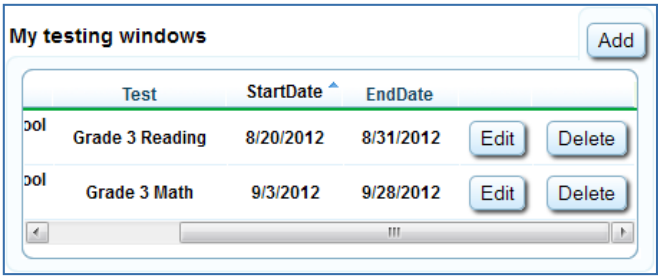


To edit a testing window:

1. Use the horizontal scroll bar to go to the last column of the table and click [**Edit**].
2. Edit the fields as necessary, and then click [**Save**].

To delete a testing window:

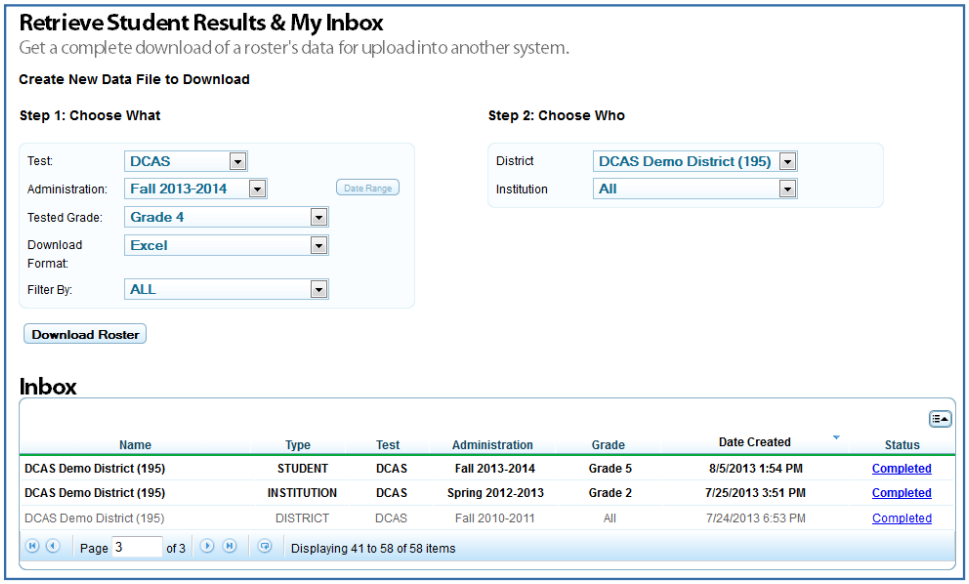
1. Use the horizontal scroll bar to go to the last column of the table and click [**Delete**].
2. A pop-up will appear asking you if you are sure that you want to delete this testing window. Click [**OK**].



Retrieve Student Results

Users can download student data for a selected test window by district, school, teacher, or roster. The data will include students' personal information, including enrolled school and district and grade level, and the selected test scores and reporting category scores (if applicable).

Users can also retrieve generated batch PDF files of individual student reports. These batch files are generated on the Student Listing Report page. *(Note: You cannot generate these PDF files on this page.)*



Step 1: Choose What

- Select an assessment type (DCAS, EOC, DCAS – Alt1, or Norm-Referenced/TerraNova) from the drop-down list.
- Select a test window from the drop-down list.
- Select the tested grade or grade band and date range (if desired).
  - OR select "All" to create a separate file for each available tested grade. These files will be provided in a Zip file.
- Select a file format. The default is an Excel (.xls) spreadsheet file.
- *Optional:* Select a demographic subgroup filter. If you select a filter other than "All," a Values drop-down will appear. Select the desired value. The data in the generated report will contain only those students who meet the selected parameter(s).

Step 2: Choose Who

- Confirm that the district is accurate (users with access to multiple districts will need to select a district).
- Select a school from the drop-down list.
  - OR select "All" to generate a report that includes all schools.
- If a school was selected, choose a teacher from the drop-down list.
  - OR select "All" to generate a report that includes all teachers within the selected school.
- If a teacher was selected, choose a roster from the drop-down list or select "All" rosters.

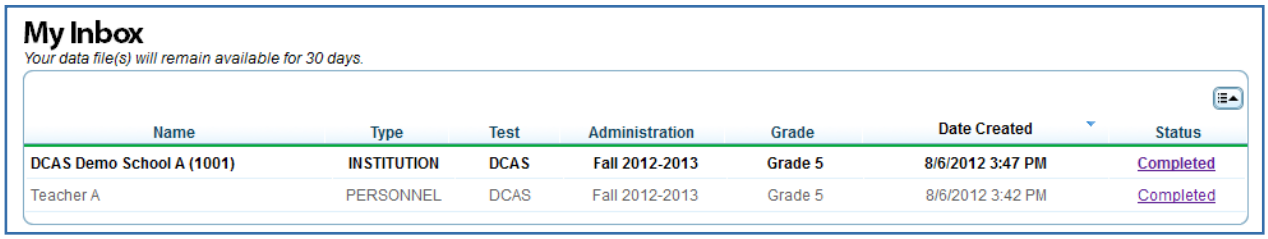
Step 3: Click the [Download Roster] button. An alert window will appear, indicating that the requested data file is being processed.

- As the requested data may take time to generate, you will receive an e-mail when the requested file is ready.

Step 4: Download the data file by clicking the [**Completed**] link next to the report in the My Inbox section. You can access the My Inbox section either by clicking the [**Inbox**] link in the header or by returning to the Test Management Center and accessing this screen. Your files will remain available for 30 days.

My Inbox

This section of the *Retrieve Student Results* page lists the data files that you requested.



The following information is shown:

- The institution name
- The type of data file you requested (district, institution, personnel, or roster)
- The test type (DCAS, EOC, DCAS – Alt1, or Norm-Referenced/TerraNova)
- The test window (e.g., fall 2011–2012, winter 2011–2012)
- The grade level of the students in the data file
- The date and time the data file was created
- The status of the request

Click the [**Completed**] link in the Status column to access the data file.

Opening and Viewing the Data File

You can download your requested student data file in either .xls or .csv format. You may also choose to download it in another format (e.g., .txt file type).

If you choose to download the file as a .txt file, then you will need to follow the instructions below to view the file in Microsoft Excel or a similar spreadsheet program.

	A	B	C	D	E	F	G	H	I	J	K	L	M	N	O	P	Q	R	S

9																			
10																			
11																			

1. Save the file to your desktop or other desired location on your computer.

2. Open Microsoft Excel.

3. Navigate to **File** > **Open**.

4. A drop-down list displaying file types will appear next to or below the File Name box. Select “Text Files (*.prn; *txt; *.csv).” The .txt file that you saved should now appear in the location in which you saved it.

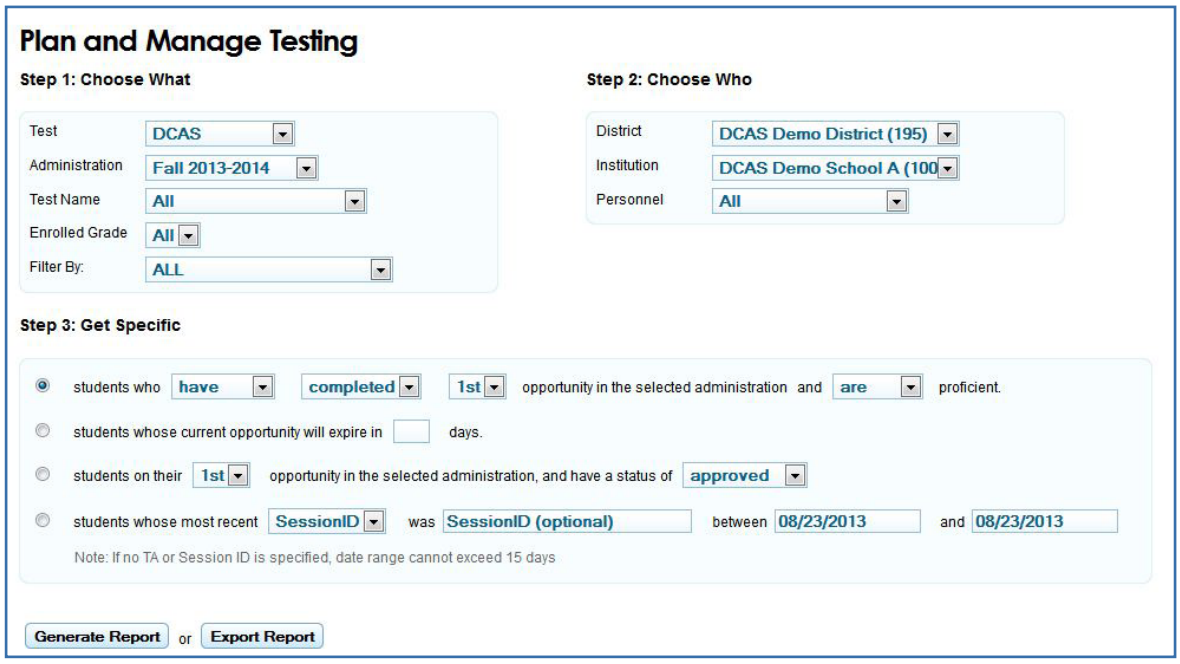
5. Select the file and click [**Open**].

6. The Text Import Wizard will open. You will have to navigate through three steps:
   a. Make sure “Delimited” is selected and click [**Next**].
   b. Click the check box next to “Other,” enter the “|” symbol (this is often on the same key as the forward slash “\”), and click [**Next**].
   c. Click [**Finish**].

7. The data will populate in separate columns in Excel. For ease in opening this file in the future, you may want to re-save the file as an Excel Workbook (.xls or .xlsx) file. This will prevent you from having to “import” the data again.

Plan and Manage Testing (Updated)

This section allows you to generate customized reports showing your students' activity in the online testing system.



Selecting the Parameters for Your Report

Step 1: Choose What

- Select an assessment type (DCAS, DCAS-EOC, DCAS – Alt1, DCAS – Alt1-SR, DCAS-Survey, or NR).
- Select a test window (e.g., Fall 2011–2012).
- Select a test (subject and grade or grade band).
- Select an enrolled grade or all grades.

Step 2: Choose Who

- For most users, the district or institution (school) you are associated with will already be displayed in the drop-down lists. Verify that it is accurate.
  - For users who are associated with more than one school and/or district, you will need to verify and/or select the district from the first drop-down menu. Once the district is selected, the list of associated schools you have access to will populate in the second drop-down menu. Select the school you want to generate a participation report for.
- *Optional:* Select the teacher (personnel) you would like to generate the report for. The default variable for this is "All."

Step 3: Get Specific
Select the Report Filter option that best matches your needs. Click the radio button for the row that has the parameters you wish to use, and then select the filters from the drop-down menu(s) in that row. For example, you may wish simply to view all students in your school who have not yet started any tests.

Four Report Filter options are available. Each filter will generate a report containing students whose information matches the parameters you have selected.

- **Display [All/Grade #] students who [have/have not] [completed/started] the [1st/2nd/3rd/4th/Any]* opportunity and [are/are not] proficient.** This filter allows you to:
  - determine which students have completed testing and are or are not proficient.
  - determine which students have or have not started testing.

- **Display students whose current opportunity will expire in [##] days.**
  - This filter allows you to determine which students who are currently testing have at least one test that will expire shortly. For example, you can enter "2" days to determine who needs to complete testing by the end of the next day.

- **Display students on their [1st/2nd/3rd/4th]* opportunity and have a status of [student test status]**
  - This filter allows you to determine which students have a specified test status for the selected test opportunity. Please refer to the test status definitions in Table 7–3 on page 54 or click [**Definitions**] on the Plan and Manage Testing page.

- **Display students whose last [Session ID/Test Administrator] was _____ between [start date] and [end date]**
  - This new filter allows you to search for students who were in a specific session and view their current test status.
  - To view this report, enter the Test Administrator's Session ID OR enter the Test Administrator's name, and then select a Session ID associated with the TA. You will also have to click on the calendar icons to select the timeframe.
  - This report will return the most recent participation data for students who have taken the selected test. The Session ID and TA name fields are optional. You can leave these fields blank and simply search for participation information within a particular date range. If the Session ID or TA name is not specified, you will be limited to a date range search of 15 days.

When you are done selecting your report parameters from the filter drop-down menus, click [**Generate Report**] to view the results on your screen, or click [**Export Report**] to open the report in Microsoft Excel (.xls).

The information displayed reflects data current as of the time you clicked [**Generate Report**]. To update the information displayed in your report, you must generate a new report. Do NOT use your Web browser's Refresh button.

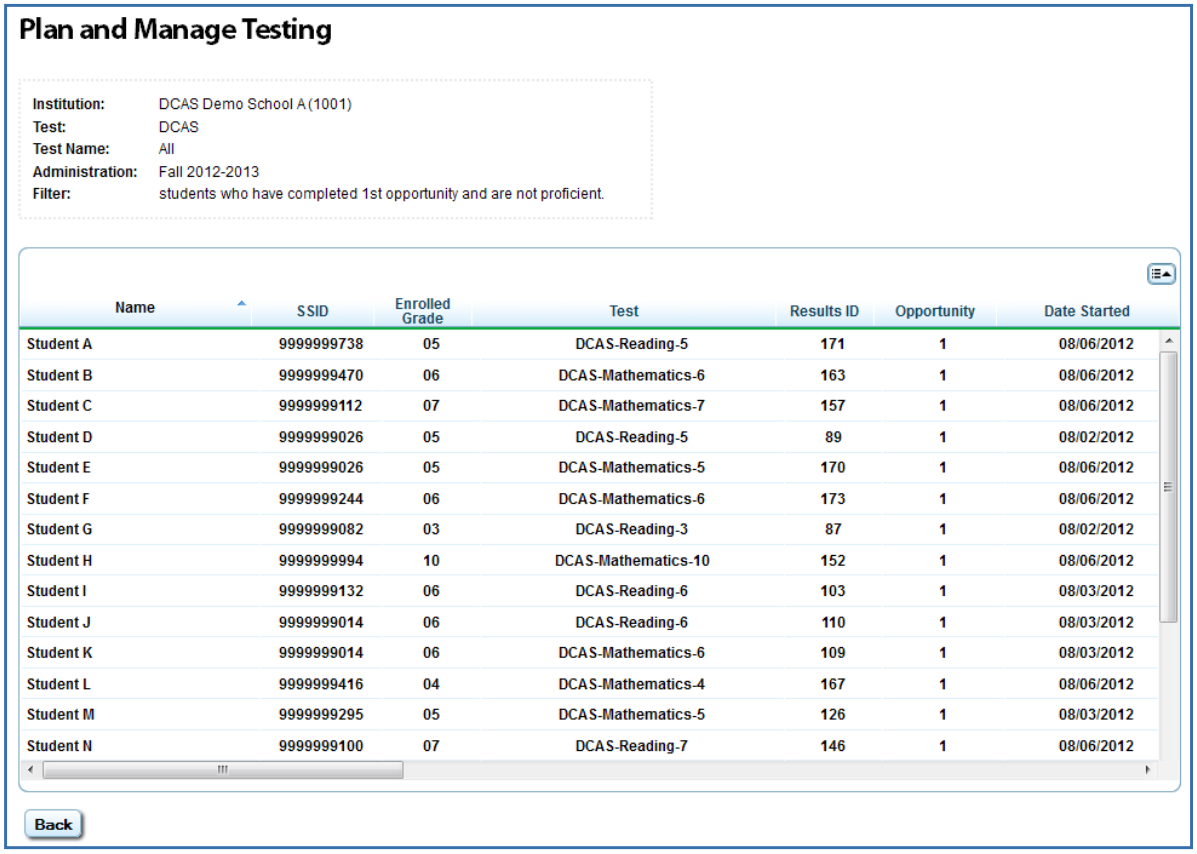
** DCAS has two test windows, plus separate administrations for EOC and DCAS – Alt1 tests. For DCAS tests, each student has one opportunity for Mathematics and Reading in the fall test window. During the spring DCAS test window, students have up to two opportunities each for Mathematics and Reading tests and one opportunity each for Science and Social Studies tests. The opportunity number shown in Plan and Manage Testing corresponds to the number of opportunities taken across the entire school year, not a single testing window.*

You may also select "any" opportunity, which will allow you to see all opportunities for students who meet the selected criteria. This is only available for the first filter.

Understanding Your Participation Report

Upon clicking [**Generate Report**], the Participation Report displays data based on your selected parameters. Each report includes a list of all students who meet your selected parameters. (If no students are listed, this means that no students matched your report criteria.)

Sample Participation Report



Plan and Manage Testing

Institution: DCAS Demo School A (1001)
Test: DCAS
Test Name: All
Administration: Fall 2012-2013
Filter: students who have completed 1st opportunity and are not proficient.

Name	SSID	Enrolled Grade	Test	Results ID	Opportunity	Date Started
Student A	9999999738	05	DCAS-Reading-5	171	1	08/06/2012
Student B	9999999470	06	DCAS-Mathematics-6	163	1	08/06/2012
Student C	9999999112	07	DCAS-Mathematics-7	157	1	08/06/2012
Student D	9999999026	05	DCAS-Reading-5	89	1	08/02/2012
Student E	9999999026	05	DCAS-Mathematics-5	170	1	08/06/2012
Student F	9999999244	06	DCAS-Mathematics-6	173	1	08/06/2012
Student G	9999999082	03	DCAS-Reading-3	87	1	08/02/2012
Student H	9999999994	10	DCAS-Mathematics-10	152	1	08/06/2012
Student I	9999999132	06	DCAS-Reading-6	103	1	08/03/2012
Student J	9999999014	06	DCAS-Reading-6	110	1	08/03/2012
Student K	9999999014	06	DCAS-Mathematics-6	109	1	08/03/2012
Student L	9999999416	04	DCAS-Mathematics-4	167	1	08/06/2012
Student M	9999999295	05	DCAS-Mathematics-5	126	1	08/03/2012
Student N	9999999100	07	DCAS-Reading-7	146	1	08/06/2012

Back

Please note that students may be listed multiple times; each opportunity is counted as a single record. For example, if a student has taken two assessments so far, that student's name will appear twice if both records meet your report parameters.

By default, the Participation Report displays 18 columns. To view all the data, you will need to use the horizontal scroll bar at the bottom of the report or use the Show/Hide Columns tool to select only the columns you wish to view.

- Table 7–2 identifies all the columns in a participation report and provides a description of each one.
- Table 7–3 identifies the definitions for each test status (listed in the status column).

Table 7–2. Column Attribute Definitions

Attribute	Description
Name	Student's legal name (Last Name, First Name).
SSID	Student's 10-digit State Student Identification Number.
Enrolled Grade	The grade in which a student is enrolled.
Test	Test name for this student record (e.g., "Fall-Grade 3 Reading").
Results ID	The unique identifier linked to the student's results for that specific opportunity.
Opportunity	The opportunity number for that student's specific record.
Date Started	The date when the first test item was presented to the student for that opportunity.
Date Completed	The date when the student submitted the test for scoring.
Restricted Subjects	The subject(s) the student is restricted (blocked) from taking tests in.
Current ELL	Indicates whether the student is categorized as an English language learner.
Assigned DCAS – Alt1 Test	If a student was assigned an alternate assessment, this column will display the subject test.
Language	The language setting that was assigned to the student (English or Spanish).
TA Name	The Test Administrator who created the session in which the student is currently testing (or in which the student completed the test).
Session ID	The Session ID to which the test is linked.
Status	The status for that specific opportunity (*see Table 7–3 for status definitions*).
Restarts	The total number of times a student has resumed an opportunity (e.g., if a test has been paused three times and the student has resumed the opportunity after each pause, this column will show three "Restarts"). (This includes Restarts Within Grace Period—see below.)
Restarts Within Grace Period	The total number of times a student has resumed an opportunity **within** 30 minutes after a test was paused (e.g., if an assessment has been paused three times and the student resumed the opportunity within 30 minutes of two pauses but 35 minutes after the third pause, then this column will show two "Restarts Within Grace Period").
Last Activity	The date of the last activity for that opportunity/record. A "completed" test can still have activity (as it goes through the QA and reporting process).
Expiration Date	The date the test opportunity expires.

Table 7–3. Test Status Definitions

Status	DCAS General Descriptions *(When students take the online tests)*	DCAS Paper and DCAS – Alt1 Descriptions *(When a TA enters responses or scores)*
Approved	The TA has approved the student for the session, but the student has not yet started or resumed the test.	The TA has completed the login process for the student's "test session," but has not yet started or resumed response or score entry.
Completed	The student has submitted the test for scoring. No additional action can be taken by the student.	The TA has completed entering the student's responses or scores and submitted the test for scoring. No additional action can be taken by the TA.
Denied	The TA denied the student entry into the session. If the student attempts to enter the session again, this status will change to "Pending" until the TA approves or denies the student.	This status does not apply to paper or alternate assessments.
Expired	The student's opportunity has not been completed and cannot be resumed because the test opportunity has expired. (Opportunities expire after 45 calendar days from the date the student started the test, or at the end of the test window.)	
Invalidated	The test result has been invalidated.	
Paused	The student's test is currently paused (as a result of one of the following): – The student paused his or her test by clicking the [**Pause**] button. – The student idled for too long and the test was automatically paused. – The Test Administrator paused the session. – The Test Administrator paused the individual student's test. – The student's browser or computer shut down or crashed.	
Pending	The student is awaiting TA approval for a new test opportunity.	This status does not apply to paper or alternate assessments.
Reported	The student's score for the completed test has been submitted to the reporting system.	
Rescored	The test opportunity was rescored.	This status does not apply to paper or alternate assessments.
Review	The student has answered all test items and is currently reviewing his or her answers before submitting the test for scoring. (A test with a "review" status is not considered complete.)	The TA has completed entering the student's responses or scores and is reviewing them before submitting the test for scoring. (A test with a "review" status is not considered complete.)
Scored	The test will display a scored status, followed by the student's score.	The student's test score is calculated and no additional action can be taken by the TA.
Started	The student has started the test and is actively testing.	
Submitted	The test has been submitted for quality assurance review and scoring before it is sent to the Online Reporting System.	
Suspended	The student is awaiting TA approval to resume a test opportunity.	This status does not apply to paper or alternate assessments.

Participation Reports Tools

Once you have generated your Participation Report, a number of on-screen tools can help you sort, organize, and analyze the data. A description of these tools follows.

- **Sort Results by Attribute**
  You may sort Participation Report data in any column. Click the column header to sort data in ascending (A–Z; 1–10) or descending (Z–A; 10–1) order. The default sort is by Student Name, in ascending order by last name.

- **View Definitions of Columns and Student Statuses**

  Click the [**Definitions**] button to view information about column attributes and other definitions relevant to your report.

- **Hide/Show Columns**
  Use the [**Hide/Show Columns**] drop-down menu to select which attributes display in your report.

- **Print Report**

  Click the [**Print**] button to print your Participation Report.
  Note: Set your Print Options to Landscape mode (horizontal) to accommodate the various columns in the report. You can also try adjusting the scale of the content (using your browser's "Print Preview" feature) to fit on a printed page.

FERPA prohibits the release of any personally identifiable information. Printed reports contain personally identifiable student data and must be securely stored and destroyed in accordance with the Materials and Test Security section of the DCAS Online Test Administration Manual (available on the DCAS portal at http://de.portal.airast.org).

Excel files should not be shared electronically and should not be stored on computers accessible to individuals who are not authorized to view confidential student information.

Exporting Participation Data into Excel

If you want to export participation results to an Excel file, click [**Export Report**] from the Participation Reports filter page. A pop-up window will appear asking if you would like to open or save your file. You can open the file and work with it immediately, or you can save it to your computer and open it to examine the data later.

The report data will be exported as a Microsoft Excel (.xls) file.

Note: You can also export results for all students in your school who are participating in online testing; however, this may take some time, depending on the amount of data involved.

Below is a sample report exported into Microsoft Excel.

Sample Excel Report: Students in Grade 5 who have completed the first opportunity in Grade 5 Mathematics and are not proficient

Test Completion Rates (New Test Management Center Report)

School and district users can create a file showing the number of students who have started and completed each test. District level users can create a file either for a specific school or for the whole district. The user can also generate the report for all tests or for one specific test. These files can be viewed in Excel or uploaded into most data analysis programs. Refer to Table 7–4 for a description of each column in the file.

Selecting the Parameters for Your Report

Step 1: Select an Entity

- Select the report level (district or school).
- If you are associated with more than one school, you can select one school or all schools.

Step 2: Select a Test

- Select a single test or all tests.

Step 3: Click [Export]

You can open or save the file and view it in Microsoft Excel.

Table 7–4. Test Completion Rates Report Column Descriptions

Column	Description
Date	The date and time that the file was generated.
Test Name	The grade, test, and subject that are being reported.
Opportunity	The test opportunity number that is being reported.
District Name	The name of the reported district.
District ID	The ID number of the reported district.
School Name	The name of the reported school.
School ID	The ID number of the reported school.
Total Student	The number of students with an active relationship to the school in TIDE. This may include students with end-dated SSIDs. (Students with end-dated SSIDS are inactive but still associated with the school in which they were most recently enrolled.)
Total Student Started	The number of students who have started the test.
Total Student Completed	The number of students who have finished the test and submitted it for scoring.
Percent Started	The percentage of students who have started the test out of the total number of students with an active relation to the school in TIDE.
Percent Completed	The percentage of students who have completed the test out of the total number of students with an active relation to the school in TIDE.

Appendix: Data Available in Score Reports

Not all data are available for all DCAS, EOC, DCAS – Alt1, and Norm-Referenced/TerraNova tests. The following tables provide an at-a-glance illustration of which reports contain which data.

Dear Educator,

The state tests administered each year measure student achievement on Minnesota's Academic Standards and the Minnesota Standards for English Language Development, developed by the WIDA Consortium. We have developed this Minnesota Assessment Interpretive Guide to help educators understand the results from these tests.

The guide contains information on how to read the reports and interpret the data from these tests. Once you have become familiar with the information, you will be in a position to gauge the effectiveness of your school's curriculum and instruction. You will also have some individual student information that can guide your students' instruction.

We encourage you to use this guide to inform parents, students, and other interested persons in your community about how the Minnesota Assessment System supports all students in their learning of the Minnesota Academic Standards and the Minnesota Standards for English Language Development.

Minnesota believes all students can learn and strives to set high standards for student performance.

State of Minnesota
Department of Education

INTRODUCTION TO THE INTERPRETIVE GUIDE FOR MINNESOTA ASSESSMENT REPORTS

Minnesota has developed an assessment system to measure student proficiency on the Minnesota Academic Standards and the Minnesota Standards for English Language Development, developed by the World-Class Instructional Design and Assessment (WIDA) Consortium. This system comprises standardized, criterion-referenced tests that provide individual and aggregate data on student performance aligned to grade-level standards.

The Minnesota Assessments have multiple uses:

- School and district results are used for school and district accountability under the Elementary and Secondary Education Act (ESEA).
- Individual student reports inform parents and students of progress in achieving the grade-level Minnesota Academic Standards and/or the Minnesota Standards for English language development.
- Individual student and aggregate summary results are available to help schools and districts make instructional and policy decisions.
- The assessments administered in high school may also be used to meet graduation assessment requirements.

Many measures of learning are necessary to derive an understanding of a student's strengths and weaknesses. Each performance measure in a comprehensive assessment system requires that users know what the data mean and how to use the data to make effective decisions.

This Interpretive Guide is intended to help educators understand the results of the Minnesota Assessments. The guide provides basic information about each assessment, describes each available report, and suggests ways to use the results. The major topics of this guide are:

- The purpose of the Minnesota Assessments
- Overview of data sites and resources
- Types of score reports
- Interpretation of scores and achievement levels
- Achievement level descriptors
- Descriptions of specific reports
- Contact information

Minnesota is part of the WIDA Consortium. As a member of this consortium, Minnesota districts administer the ACCESS for ELLs assessment to English learners in grades K–12. "ACCESS for ELLs" stands for Assessing Comprehension and Communication in English State-to-State for English Language Learners. In addition, the Alternate ACCESS for ELLs is available in grades 1–12 for English learners with significant cognitive disabilities. The ACCESS for ELLs and Alternate ACCESS for ELLs fulfill the Title III requirement of the ESEA. The purpose of these assessments is to measure students' achievement on the Minnesota Standards for English Language Development, developed by the WIDA Consortium. Information about reports for ACCESS for ELLs and Alternate ACCESS for ELLs is not included in this guide; for more information, please refer to the "Interpretive Guide for Score Reports" on the WIDA website (http://www.wida.us). View the WIDA website (http://www.wida.us/assessment/ACCESS/). In addition, please refer to the Data Sites and Resources section later in this manual about how to find ACCESS for ELLs and Alternate ACCESS for ELLs results on the Minnesota Department of Education (MDE) website.

References to additional information on the MDE website (http://education.state.mn.us) and Minnesota Assessments portal (www.mnstateassessments.org) are referenced throughout this manual. The Minnesota Assessments portal is the American Institutes for Research (AIR) website; AIR is the service provider for the Title I and GRAD assessments.

> No single assessment can comprehensively measure a student's learning in a school or environment. Results on the Minnesota Assessments are only a subset of the data that schools and districts can use to determine how well students have acquired the knowledge and skills on the Minnesota Academic Standards and Minnesota Standards for English Language Development and how well the school is teaching them.

PURPOSE OF THE MINNESOTA ASSESSMENTS

Title I Assessments

Minnesota Comprehensive Assessment in Reading, Mathematics, and Science

In 2013, the Minnesota Comprehensive Assessment (MCA) was administered to students in reading in grades 3–8 and 10, mathematics in grades 3–8 and 11, and science in grades 5, 8, and high school. The purpose of the MCA is to measure Minnesota students' achievement on the Minnesota Academic Standards. The MCA results inform curriculum decisions at the district level; inform instruction at the classroom level; and, in reading and mathematics, demonstrate student academic progress from year to year.

The Reading and Mathematics MCA are the primary assessments Minnesota uses for ESEA accountability. All students are required to take these tests or a designated replacement, such as the Reading and Mathematics MCA-Modified for persistently low-performing students or the Reading and Mathematics Minnesota Test of Academic Skills (MTAS) for students with significant cognitive disabilities. The test results are used to calculate Adequate Yearly Progress (AYP) and Multiple Measurement Ratings (MMR) for Minnesota schools and districts. MCA results can be used to compare schools and districts across the state. Science MCA participation (or Science MTAS, for eligible students) is required under ESEA but is not included in AYP or MMR calculations at this time.

Minnesota Comprehensive Assessment-Modified (MCA-Modified) in Reading and Mathematics

The MCA-Modified is an alternate assessment in reading and mathematics in grades 5–8, reading in grade 10, and mathematics in grade 11 based on the same academic standards as the MCA but with modified achievement standards. The MCA-Modified is positioned between the MCA and the MTAS. Participation is limited to persistently low-performing students receiving special education services whose IEP team determines that they meet eligibility requirements for the MCA-Modified.

Minnesota Test of Academic Skills (MTAS) in Reading, Mathematics, and Science

The Minnesota Test of Academic Skills (MTAS) is an alternate assessment in reading and mathematics in grades 3–8, reading in grade 10, mathematics in grade 11, and science in grades 5, 8, and high school that is based on alternate achievement standards. The MTAS is part of a statewide program that measures the extent to which students with the most significant cognitive disabilities are making progress in the general education curriculum on standards that have been reduced in breadth, depth, and complexity.

The MTAS is a performance-based assessment where performance tasks in reading, mathematics, and science are administered to students in a one-on-one setting. Test administrators score performance tasks using a script and task-specific scoring rubric.

Assessments to Meet Graduation Assessment Requirements

In order to be eligible for a diploma from a Minnesota public high school, all students must fulfill graduation assessment requirements. Based on new legislation in 2013, these requirements have changed, and students are no longer required to meet the Graduation-Required Assessment for Diploma (GRAD) requirements in reading, mathematics, and writing in order to receive a diploma. However, meeting the GRAD requirements is still one of the options available for students enrolled in grade 8 through 2011–2012.

In 2012–2013, students could meet the GRAD requirements as follows:

- Earning a proficient score on a high school reading or mathematics Title I assessment (MCA, MCA-Modified, or MTAS) or passing the GRAD component embedded in the Mathematics MCA
- Earning a passing score on the Written Composition GRAD
- Passing Reading and Mathematics GRAD retests
- Meeting GRAD alternate routes:
    - Meet mathematics alternate pathway requirements (for students in grade 8 through 2009–2010 only)
    - Receive an individual passing score (for students on an IEP or 504 plan)

- Receive an English language learner (ELL) exemption
- Pass an accountability assessment from another state approved by MDE

Additional information about the legislative changes to the graduation assessment requirements is available on the Test Administration page of the MDE website. View the Test Administration page (http://education.state.mn.us/MDE/SchSup/TestAdmin/index.html). Further information about GRAD alternate routes is available in the *Procedures Manual for the Minnesota Assessments*, which is posted to the Minnesota Assessments portal. View the *Procedures Manual* on the Minnesota Assessments portal (http://www.mnstateassessments.org/resources/?section=1).

Test Specifications

Test specifications are specific rules and characteristics that guide the development of a test's content and format. They indicate which strands, sub-strands, standards, and benchmarks will be assessed on the test and in what proportions. View test specifications for the Title I and GRAD assessments on the Test Specifications section of the MDE website (http://education.state.mn.us/MDE/EdExc/Testing/TestSpec/index.html).

DATA SITES AND RESOURCES

MDE Data Center

There are two sections of the Data Center on the MDE website where educators can analyze test results and create, view, and download reports that meet their needs. The Data for Parents and Educators section is open to the public and allows the user to view and analyze data for any public school or district in the state. The only restriction is that data are suppressed when a data set consists of fewer than 10 students. To access the Data for Parents and Educators section, go to the MDE website, choose "Data Center," and then choose "Data for Parents and Educators." Information about how to use this section of the website is included on the Data for Parents and Educators pages.

The MDE Secured Reports section is only open to educators who have obtained permission to access secured reports from their superintendents. This section allows users to download student-level information through the District Student Results (DSR) or School Student Results (SSR) files, as well as test results summary information for each test. To access the MDE Secured Reports section, go to the MDE website, choose "Data Center", choose "Data Reports and Analytics", and then choose the applicable report from the list under MDE Secured Reports. The user guide is included on both the DSR and SSR and Test Results Summary pages.

Online Reporting System

AIR's Online Reporting System (accessed through the Minnesota Assessments portal) allows authorized users to view preliminary student test data for Title I and GRAD assessments. Depending on a user's role, he or she can view performance data at the student, roster, school, and district levels. Participation data can be viewed to see what percentage of students have completed testing and who still needs to complete tests.

Please note that the data available in the Online Reporting System should not be considered as official for accountability purposes; official accountability data are provided to districts by MDE. Districts can use the information in the Online Reporting System for instructional purposes or to inform about graduation status and may share score information with students and families. However, only the data provided by MDE should be used for official student record-keeping.

Learning Point Navigator

AIR's Learning Point Navigator system (also accessed through the Minnesota Assessments portal) is a tool that allows teachers to access curricular support resources to assign to students. Teachers can use the site to enhance students' learning by creating assignments that focus on standards and benchmarks in Mathematics, English Language Arts (Reading) and Science. After students complete assignments, they can see their raw scores. Teachers can also view individual student and class reports for each assignment given.

Learning Point Navigator is accessed through the Minnesota Assessments portal by selecting either the "Teacher/Test Monitor" or "Assessment Coordinator" icon on the home page and then selecting Learning Point Navigator.

District personnel must define school- and teacher-level users' roles in AIR's Test Information Distribution Engine (TIDE) and then create rosters for them in TIDE or via the Manage Rosters tool in the Online Reporting System in order for these school-level users to create assignments for students in Learning Point Navigator.

Lexile Website

The Reading MCA individual student reports include predicted Lexile score ranges. The *Lexile© Framework* is a system that helps match readers with literature appropriate for their reading skills. When reading a book within the predicted Lexile range, the reader should comprehend enough of the text to make sense of it, while still being challenged enough to maintain interest and learn. View the Lexile website for more information about the Lexile Framework (http://www.lexile.com/).

TYPES OF FINAL SCORE REPORTS FOR MCA, MCA-MODIFIED, MTAS, AND GRAD

Score reports are generated for each district and school. The following table lists the types of reports that are available for final results.

Report			
Name	**Format**	**District**	**School**
Student Results Files			
District (DSR)	Online	✓	
School (SSR)	Online		✓
Summary Files			
District	Online	✓	
School	Online	✓	✓
Student Reports Shipment			
Home Copy	Paper		✓
Student Results Labels (optional for Title I)	Paper		✓

See the Data Sites and Resources section for more information about student results files and summary files that are available through MDE Secured Reports; the student reports are described in detail later in this manual. Schools' student reports shipments are packaged by school and delivered to the districts for distribution. Preliminary results information is available in the Online Reporting System as described in the Data Sites and Resources section.

INTERPRETING SCORES AND ACHIEVEMENT LEVELS

The following types of information are available on the summary files:

- Percent of students proficient
- Percent of students at each achievement level
- Average scale scores (for the total test)
- Average sub-scores (for strands, sub-strands, and extended benchmarks)

For each of these scores, you can compare the results for your school and district to those for schools and districts of interest to you or to the state through the Data Center section of the MDE website. For example:

- Compare average sub-scores. If the number of possible points for a particular sub-score is small, be cautious when interpreting small differences. Use differences in average sub-scores to guide further investigation of the curriculum and instruction at the school or district level.
- Compare different perspectives, such as average scale scores and percent proficient. For example, your district or school may have a lower average scale score than the state, but the percent of students who are proficient may be greater than the state.
- Look at the distribution of your students' scale scores and sub-scores. Averages can be strongly influenced by students with very high or very low scores.

The distribution of an entire group's scores may help you better understand the strengths and weaknesses of your students, especially when the sub-scores' distributions are included. The District and School Student Results (DSR and SSR) files give you the data electronically, which makes it easier to see a distribution of scores. For more information, refer to the Data Sites and Resources section of this manual.

The average sub-scores for MCA-III assessments are reported on a standardized 1 to 9 scale that is intended to facilitate comparison of strand performance across strands and years. On other tests (MCA-II, MCA-Modified and MTAS), sub-scores are reported as raw score points earned, and schools and districts can only be appropriately compared within a particular year for those assessments. Such comparisons can tell an organization about its strengths or areas needing improvement relative to other schools or districts. Sub-scores based on raw score points are not equated for differences in difficulty for a given year; one strand or sub-strand may have items that are more difficult than others. Thus, direct comparisons between different sub-scores or across multiple years may be misleading. Be cautious when making comparisons between strands or sub-strands.

Trend data are available for the Minnesota Assessments. However, please use caution when interpreting trend data because assessments change when academic standards are revised. For example, a new baseline for mathematics was set in 2011, for science in 2012, and for reading in 2013. For this reason, comparisons between the percentage of students who scored proficient should be done only when keeping in mind the standards measured from one year to the next.

Development of the Achievement Level Descriptors (ALDs)

The Achievement Level Descriptors (ALDs) give descriptive information about what typical students are expected to know of the Minnesota Academic Standards.

The ALDs were developed focusing on the content of the Minnesota Academic Standards. Preliminary drafts of the ALDs were provided for the standard setting panels as they began their work to determine cut scores for each of the achievement levels. After standard setting, minor adjustments were made to more accurately reflect the skills demonstrated by students at each of the achievement level score ranges. View the full ALDs on the MDE website (http://education.state.mn.us/MDE/EdExc/Testing/AchievLevDesc/index.html).

Performance definitions are the equivalent of the ALDs for the ACCESS for ELLs and the Alternate ACCESS for ELLs English language proficiency assessments. These descriptors assist families, teachers, and administrators with the interpretation of the proficiency levels reported on a six point scale. In addition to performance definitions, "Can Do" descriptions are available for the levels of performance on the ACCESS for ELLs. Both the performance definitions and the Can Do statements can be found in the documents listed in the Downloads and Products section of the Can Do Descriptors page of the website. View the CAN Do descriptors page (http://wida.us/standards/CAN_DOs/). Performance definitions for the Alternate ACCESS for ELLS are available in the Alternate ACCESS for ELL's section of the WIDA website under Downloads and Products. View the Performance Definitions on the Alternate ACCESS for ELLs page (http://wida.us/assessment/alternateaccess.aspx).

How to Use the ALDs

The ALDs can be used to communicate with parents, students, and the public about the basic skills and knowledge expected of the typical student at each achievement level. The ALDs give concrete meaning to a scale score and its associated achievement level. They can be used as examples when talking with others about student performance. The ALDs may be used as a tool to inform parents of the performance expectations for their child and to suggest changes in skills and knowledge as a student moves from one achievement level to a higher level.

The ALDs can also be used by educators in instructional planning. The ALDs can help teachers develop curriculum maps to reflect the building of skills on each of the benchmarks. Teachers may also find the ALDs useful as they develop their school improvement plans. If a school uses Minnesota assessment data with formative assessment to group students for instruction, the ALDs may be used to provide some cursory information about the skills and knowledge that need emphasis to move the students to the next achievement level. If a student is involved in supplemental services related to his or her performance on an assessment, then a service provider might use the ALDs to identify the scaffolding of skills needed to help the student reach proficiency on skills measured in previous grades so that the student can be successful in his or her current grade.

When using any of the Minnesota ALDs, it is important to remember that the performance of an individual student at an achievement level may vary from the descriptors.

TITLE I ASSESSMENTS

MCA

Scale Score

The raw score totals for Science and grade 11 Mathematics MCA are converted to a scale score specific to each test subject and grade. For the grades 3–8 Mathematics MCA and all grades of the Reading MCA, the scale score is not based on the raw score total; it is based on the specific pattern of correct and incorrect responses given by the student. Use the scale score to determine how the student did on the test. Each year, the test is equated for difficulty with the previous year's test. This means the scale score has equivalent meaning and provides a valid comparison from year to year for a given grade and subject.

For each Reading, Mathematics and Science MCA, the scale score can range from G01 to G99, with "G" standing for "Grade." The first digit (i.e., 3–8) or first two digits (i.e., 10 or 11) represent the student's grade when tested. The last two digits of the number identify the position of the score on the grade scale. For example, a student in grade 4 could earn a scale score between 401 and 499, while a student in grade 11 could earn a scale score between 1101 and 1199. Note: While the high school Science MCA can be administered in any grade (9–12) depending on coursework completion, grade 10 is used to represent the grade for the high school scores.

For the grades 3–8 and 10 Reading MCA, please note that the scale score should not be directly compared to scores from previous years. These tests are new and based on the 2010 revised reading academic standards. Grades 3–8 Mathematics MCA scores can only be compared to 2011 and 2012 scale scores as 2011 was the first year of the assessment based on the 2007 revised mathematics academic standards. Grades 5, 8 and high school Science MCA scores can be compared to 2012 scale scores because 2012 was the first year of the assessment based on the 2009 revised science academic standards.

For assessments that convert raw scores to scale scores (Science MCA and grade 11 Mathematics MCA), more than one raw score point may be assigned the same scale score, except at the cut scores for each achievement level or at the maximum possible score of G99. Specific details regarding the raw score to scale score relationship are reported on the Technical Reports section of the MDE website. View the Technical Reports section of the MDE website (http://education.state.mn.us/MDE/SchSup/TestAdmin/MNTests/TechRep/index.html).

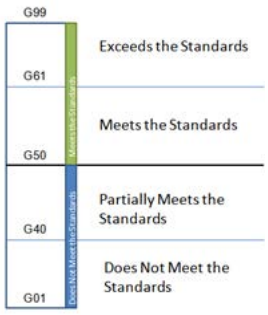
Achievement Levels

There are four achievement levels for the MCA:

- Exceeds the Standards (E)
- Meets the Standards (M)
- Partially Meets the Standards (P)
- Does Not Meet the Standards (D)

Students are assigned an achievement level based on their scale score. For the MCAs, the diagram to the right illustrates the commissioner-approved cut scores used to assign achievement levels. The cut scores for levels Partially Meets the Standards (P) and Meets the Standards (M) are G40 and G50, respectively. The cut score for level Exceeds the Standards (E) varies by grade and subject.

MCA Scale Scores & Achievement Levels



- Each Grade level will have the same score range (G01 to G99), with G = Grade.
- Last two digits of the number identify the position within the scale range.
- The first one or two digits represent the grade.
- The first two cut scores will be constant over years, G40 and G50. The third cut score varies by grade and subject.

Sub-Scores

The sub-scores for the mathematics grade 11 strands are the raw score points earned by the student on each strand or sub-strand. The number of possible points for each sub-score varies by grade, subject, and year. The school, district, and state averages of these sub-scores are available at the MDE website under Data Center. The sub-scores for the

mathematics grades 3–8, reading and science strands are the scale scores (reported on a 1 to 9 scale score metric) earned by the student for each strand.

For more information on sub-scores, reference the applicable test specifications on the MDE website. View the Test Specifications page of the MDE website (http://education.state.mn.us/MDE/EdExc/Testing/TestSpec/index.html).

Mathematics Sub-Scores

The Mathematics MCA sub-scores reported for grade 11 reflect the four mathematics strands from the Mathematics Standard of the 2003 Minnesota Academic Standards, which are outlined in the MCA-II test specifications However, the Number Sense strand is not reported separately for the MCA component of the test; it is embedded in the other three strands.

- **Number Sense:** understanding numbers, operations, and quantitative reasoning
- **Patterns, Functions & Algebra:** understanding patterns, relationships, and algebraic reasoning (the use of symbols to represent real-world situations)
- **Data, Statistics & Probability:** understanding probability (the chance that an event will occur) and statistics (the collection, organization, and interpretation of data)
- **Spatial Sense, Geometry & Measurement:** understanding geometry and spatial reasoning (the location/position of an object and the amount of space it occupies in the real world)

The Mathematics MCA sub-scores reported for grades 3–8 represent the four mathematics strands from the Mathematics Standard of the 2007 Minnesota Academic Standards. The strands are outlined in the test specifications.

- **Number & Operation:** understanding meanings of numbers and operations and how they relate to each other, computing fluently, and making reasonable estimates
- **Algebra:** models to understand, represent, and analyze patterns, relations, and functions
- **Geometry & Measurement:** analyzing characteristics and properties of two- and three-dimensional geometric shapes and developing mathematical arguments about geometric relationships; understanding the units, systems, and processes of measurement
- **Data Analysis** (grades 3–5) and **Data Analysis & Probability** (grades 6–8)**:** organizing and displaying relevant data to answer questions; understanding and applying basic concepts of probability

The grades 3–8 mathematics reports have the same four sub-score categories.

Reading Sub-Scores

The Reading MCA sub-scores reflect the sub-strands of Literature and Informational Text from the 2010 Minnesota Academic Standards in Language Arts, which are outlined in the test specifications. All the reading reports—grades 3–8 and 10—have the same sub-score categories.

- **Literature:** use strategies to analyze, interpret, and evaluate fiction (such as short stories, fables, poetry, and drama).
- **Informational Text:** use strategies to analyze, interpret, and evaluate nonfiction (such as expository and persuasive text, and literary nonfiction).

The ten reading standards are organized under four skill domains. The skill domains are Key Ideas and Details (standards 1-3), Craft and Structure (standards 4-6), Integration of Knowledge and Ideas (standards 7-9), and Range of Reading and Level of Text Complexity (standard 10). Seven of the ten reading standards are assessed on the Reading MCA-III. Standards 7, 9, and 10 are best assessed using classroom measures and are not assessed in the MCA-III.

Science Sub-Scores

The Science MCA sub-scores are for the four strands in grades 5 and 8 and two strands in high school from the Science Standards of the 2009 Minnesota Academic Standards and are outlined in the test specifications

Grade 5 Strands

- **Nature of Science & Engineering:** conducting controlled scientific investigations, constructing explanations based on evidence, identifying engineering solutions to problems

- **Physical Science:** describing and experimenting with the properties of matter, light, heat, sound, electricity, magnetism, and force and motion
- **Earth & Space Science:** modeling the positions of Earth, the Sun and the Moon, describing how weathering and erosion shape Earth's surface and how water moves through the water cycle
- **Life Science:** identifying structures and functions of organisms and relationships among organisms, and understanding individual differences give advantages in survival

Grade 8 Strands

- **Nature of Science & Engineering:** understanding how humans affect scientific investigations, designing and conducting investigations, communicating results, and refining engineering solutions
- **Physical Science:** differentiating between physical and chemical changes, understanding properties of waves and force and motion of an object, and describing changes in energy
- **Earth & Space Science:** understanding how forces affect motions of objects in the universe, describing weather patterns, and understanding the processes that occur on Earth
- **Life Science:** identifying changes in energy within an ecosystem, understanding cell processes and genetic variation, and describing the effect of humans on ecosystems

High School Strands

- **Nature of Science & Engineering:** analyzing risks and benefits of engineering solutions accurately communicating scientific results, and testing hypotheses
- **Life Science:** describing cell functions and processes, understanding relationships of organisms in an ecosystem, and the role of DNA and variation in evolution

CAUTION – Use care when interpreting:

- **Data involving few students or test items:** The more students taking the test or more test items measuring the concepts, the more confident you can be of the results.
- **Sub-scores that are reported as raw score points:** The difficulty of a strand or sub-strand and points possible will likely vary by grade, subject, and year.

MCA-Modified

Scale Score

The raw score totals for Mathematics and Reading MCA-Modified are converted to a scale score for each test subject and grade. This scale score represents how the student performed on the test. Each year, the test is equated for difficulty with the previous year's test, which means the scale score permits a valid comparison of achievement from year to year for a given grade and subject.

Achievement Levels

There are four achievement levels for the MCA-Modified:

- Exceeds the Modified Achievement Standards (E)
- Meets the Modified Achievement Standards (M)
- Partially Meets the Modified Achievement Standards (P)
- Does Not Meet the Modified Achievement Standards (D)

Students are assigned an achievement level based on their scale score. The cut scores for levels Partially Meets the Standards (P) and Meets the Standards (M) for all grades and subjects are 190 and 200, respectively. The cut score for level Exceeds the Standards (E) varies by grade and subject.

Specific details regarding the raw score to scale score relationship are reported on the Technical Reports section of the MDE website. View the Technical Reports section of the MDE website (http://education.state.mn.us/MDE/SchSup/TestAdmin/MNTests/TechRep/index.html).

Sub-Scores

The sub-scores are the raw score points earned by the student on the mathematics strands and the reading sub-strands. The number of possible points for each sub-score varies by grade, subject, and year. The school, district, and state averages of these sub-scores are available at the MDE website under Data Center.

Mathematics Sub-Scores

The Mathematics MCA-Modified sub-scores in grade 11 reflect the four mathematics strands from the Mathematics Standard of the 2003 Minnesota Academic Standards and are outlined in the grade 11 MCA-Modified test specifications.

- **Number Sense:** understanding numbers, operations, and quantitative reasoning
- **Patterns, Functions & Algebra:** understanding patterns, relationships, and algebraic reasoning (the use of symbols to represent real-world situations)
- **Data, Statistics & Probability:** understanding probability (the chance that an event will occur) and statistics (the collection, organization, and interpretation of data)
- **Spatial Sense, Geometry & Measurement:** understanding geometry and spatial reasoning (the location/position of an object and the amount of space it occupies in the real world)

The Mathematics MCA-Modified sub-scores in grades 5–8 represent the four mathematics strands from the Mathematics Standard of the 2007 Minnesota Academic Standards. The strands are outlined in the test specifications.

- **Number & Operation:** understanding meanings of numbers and operations and how they relate to each other, computing fluently, and making reasonable estimates
- **Algebra:** models to understand, represent, and analyze patterns, relations, and functions
- **Geometry & Measurement:** analyzing characteristics and properties of two- and three-dimensional geometric shapes and developing mathematical arguments about geometric relationships; understanding the units, systems, and processes of measurement
- **Data Analysis** (grade 5) and **Data Analysis & Probability** (grades 6–8)**:** organizing and displaying relevant data to answer questions; understanding and applying basic concepts of probability

The grades 5–8 mathematics reports have the same four sub-score categories. The grade 11 report has only three sub-scores; the Number Sense strand is embedded in the other three stands and is not reported.

Reading Sub-Scores

The Reading MCA Modified sub-scores reflect the sub-strands of Literature and Informational Text from the 2010 Minnesota Academic Standards in Language Arts, which are outlined in the test specifications. All the reading reports—grades 5–8 and 10—have the same sub-score categories.

Reading sub-strands:

- **Literature:** use strategies to analyze, interpret, and evaluate fiction (such as short stories, fables, poetry, and drama).
- **Informational Text:** use strategies to analyze, interpret, and evaluate nonfiction (such as expository and persuasive text, and literary nonfiction).

The ten reading standards are organized under four skill domains. The skill domains are Key Ideas and Details (standards 1-3), Craft and Structure (standards 4-6), Integration of Knowledge and Ideas (standards 7-9), and Range of Reading and Level of Text Complexity (standard 10). Seven of the ten reading standards are assessed on the Reading MCA-Modified-III. Standards 7, 9, and 10 are best assessed using classroom measures and are not assessed in the MCA-Modified-III.

MTAS

Scale Score

The raw score totals for Mathematics, Reading, and Science MTAS are converted to a scale score for each test subject and grade. This scale score represents how the student performed on the test. Each year, the test is equated for difficulty with the previous year's test, which means the scale score permits a valid comparison of achievement from year to year for a given grade and subject.

Achievement Levels

There are four achievement levels for the MTAS:

- Exceeds the Alternate Achievement Standards (E)
- Meets the Alternate Achievement Standards (M)
- Partially Meets the Alternate Achievement Standards (P)
- Does Not Meet the Alternate Achievement Standards (D)

Students are assigned an achievement level based on their scale score. The cut scores for levels Partially Meets the Standards (P) and Meets the Standards (M) for all grades and subjects are 190 and 200 respectively. The cut score for level Exceeds the Standards (E) varies by grade and subject.

Specific details regarding the raw score to scale score relationship are reported on the Technical Reports section of the MDE website. View the Technical Reports section of the MDE website (http://education.state.mn.us/MDE/SchSup/TestAdmin/MNTests/TechRep/index.html).

Sub-Scores

The sub-scores are the raw score points earned by the student on the mathematics, reading, and science tasks identified by the essence statements described in the MTAS test specifications. The number of possible points for each task is 3. Each MTAS sub-score may stem from a single or multiple tasks. The sum of an individual student's sub-scores is the student's total raw score.

CAUTION – Use care when interpreting:

- **Data involving few students or test items:** The more students taking the test or more test items measuring the concepts, the more confident you can be of the results.
- **Sub-scores:** The difficulty of a strand or sub-strand and raw score points possible will likely vary by grade, subject, and year.

GRAD ASSESSMENTS

Written Composition GRAD

The total score for Written Composition GRAD is the holistic score earned by the student. Students write to one prompt and the paper is assigned a score between 1–6 based on the rater's overall impression of the writing. A score of 3 or higher is required to pass the Written Composition GRAD.

Reading and Mathematics GRAD

The raw score totals for Reading and Mathematics GRAD are converted to a scale score and the scale score is used to determine how the student performed on the test. Each test is equated for difficulty with the previous tests, which means the scale score provides a valid comparison from test to test for a given grade and subject. The passing score for the GRAD is 50 in a scale score range of 15–85.

Reading Sub-Scores

The Reading GRAD sub-scores align with the three sub-strands of the Reading and Literature strand of the Language Arts Standards from the Minnesota Academic Standards and are outlined in the Minnesota GRAD Test Specifications for Reading.

- **Vocabulary Expansion:** using a variety of strategies to expand reading vocabulary (the use of context clues to understand new words)
- **Comprehension:** showing understanding of the meaning of text and demonstrating literal, interpretive, inferential, and evaluative comprehension
- **Literature:** demonstrating the ability to read, understand, respond to, analyze, evaluate, and interpret a wide variety of fiction and nonfiction text

Mathematics Sub-Scores

The Mathematics GRAD sub-scores align with Minnesota Graduation-Required Assessments for Diploma (GRAD) Test Specifications for Mathematics.

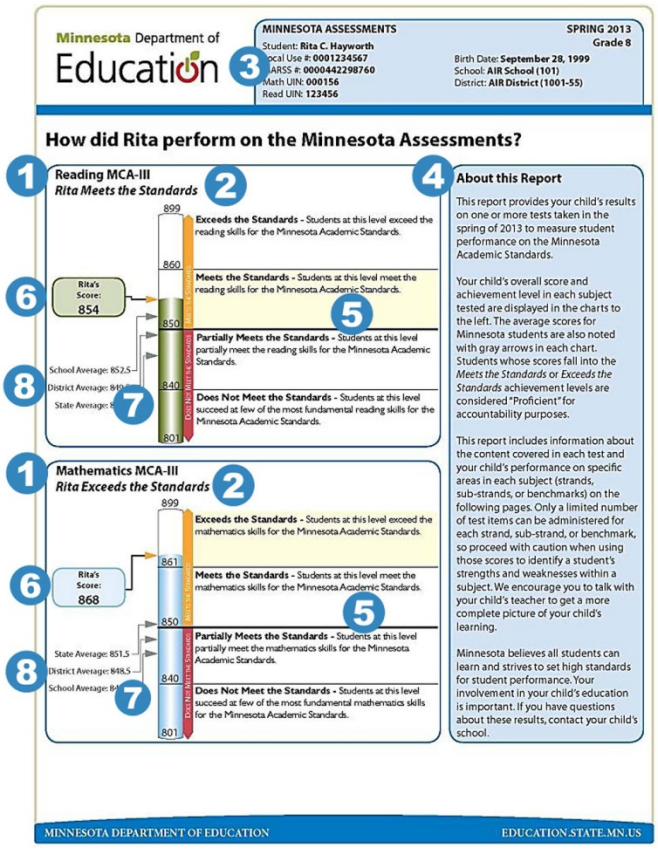
- **Number Sense:** understanding numbers, operations, and quantitative reasoning
- **Patterns, Functions & Algebra:** understanding patterns, relationships, and algebraic reasoning (the use of symbols to represent real-world situations)
- **Data, Statistics & Probability:** understanding probability (the chance that an event will occur) and statistics (the collection, organization, and interpretation of data)
- **Spatial Sense, Geometry & Measurement:** understanding geometry and spatial reasoning (the location/position of an object and the amount of space it occupies in the real world).

REPORT DESCRIPTIONS FOR TITLE I ASSESSMENTS

General Description of the MCA, MCA-Modified, and MTAS Individual Student Report

An Individual Student Report (ISR) is generated for every student who took the assessment. The ISR describes an individual student's performance in terms of scale score, achievement level, and Minnesota Academic Standards for each subject.

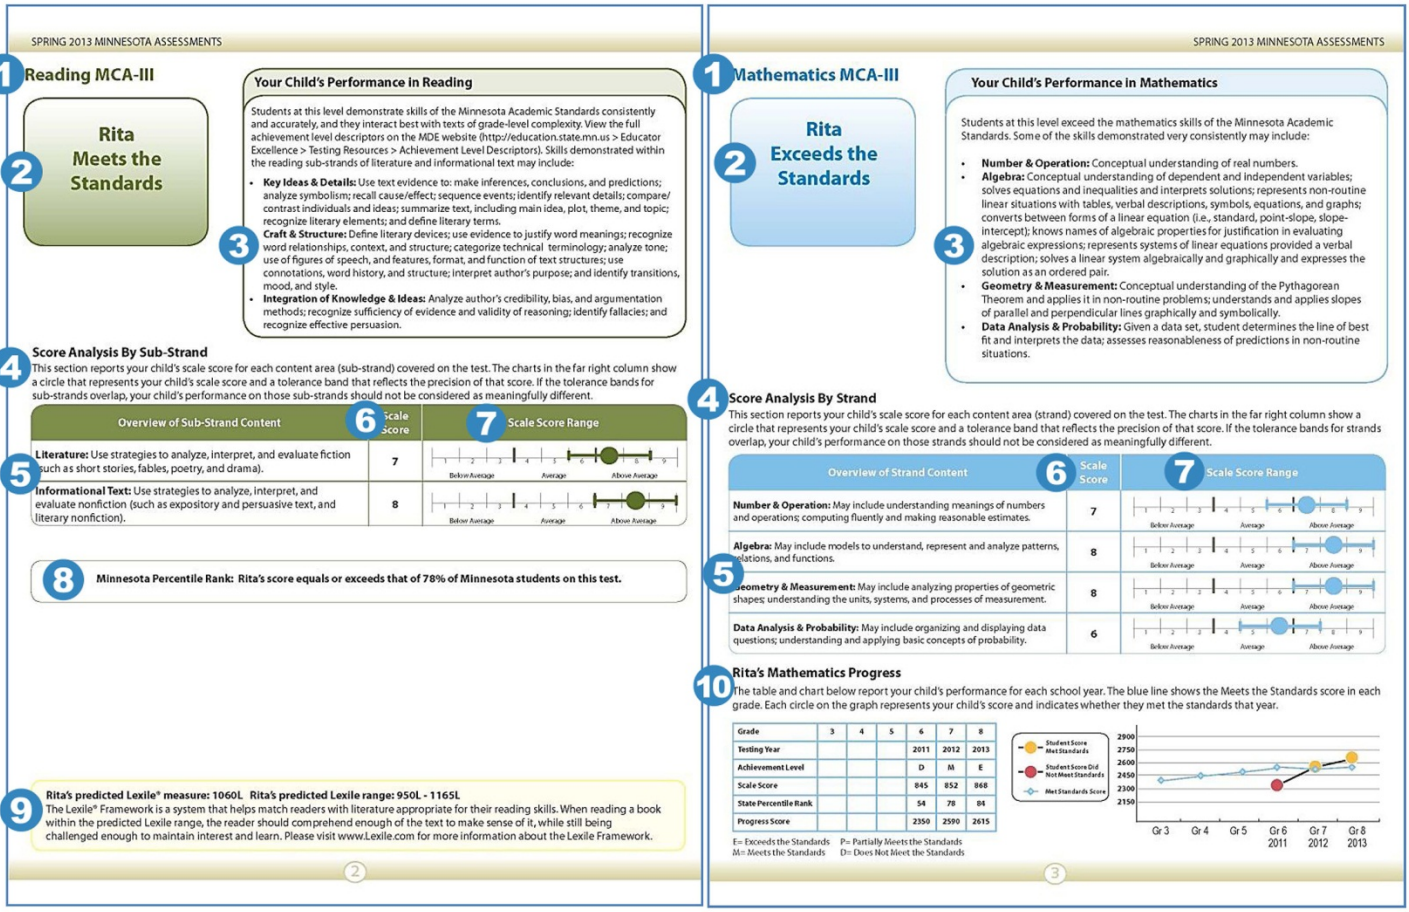
Schools will receive a hard copy of each student's ISR to send home with the student or to mail to the student's parent/guardian. For the hard copy paper ISRs, reading and mathematics results are printed on one 4 page report; science is printed on a separate 1 page report. Districts can also access final student-level information through the DSR and SSR files provided on the MDE website.



Description of the Reading and Mathematics MCA Sample Individual Student Report – Page 1

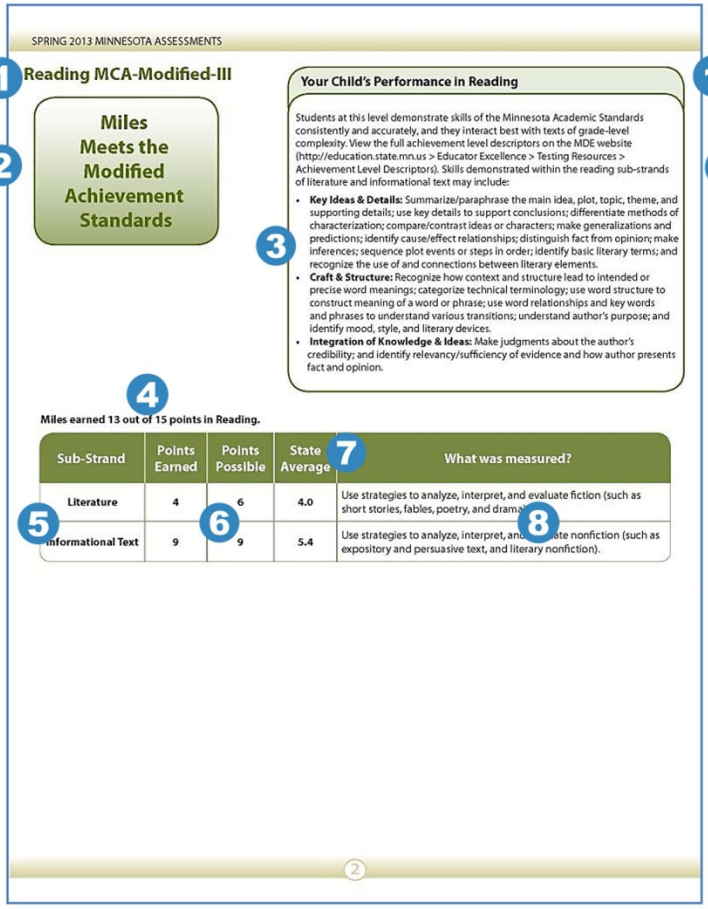
1. **Subject and Test** – The subject and test being reported.
2. **Student's Achievement Level** – The achievement level earned by the student in the subject.
3. **Student Demographic Information** – A description of the demographic information for the student, including: Student Name, Local Use # (optional number assigned by districts to aid in sorting data), MARSS Number (unique student number), UIN (unique identification number assigned by the vendor and MDE), Grade, Birth Date, School, District.
4. **About this Report** – A brief description of the assessment.
5. **Achievement Levels** – A student can achieve one of four levels for each subject: Exceeds the Standards, Meets the Standards, Partially Meets the Standards, or Does Not Meet the Standards.
6. **Student's Performance** – A graphical representation of the relationship between the achievement level and the scale score the student earned for the subject.
7. **Scale Score Range** – A scale score is a conversion of a student's raw score that equalizes possible differences in test difficulty from one year to the next.
8. **School, District, and State Comparison** – This section graphically shows the average scale score for all tested students in the school, district, and state. It provides a quick comparison of the student's performance to reference groups. MTAS and MCA-Modified averages are reported only at the state level.

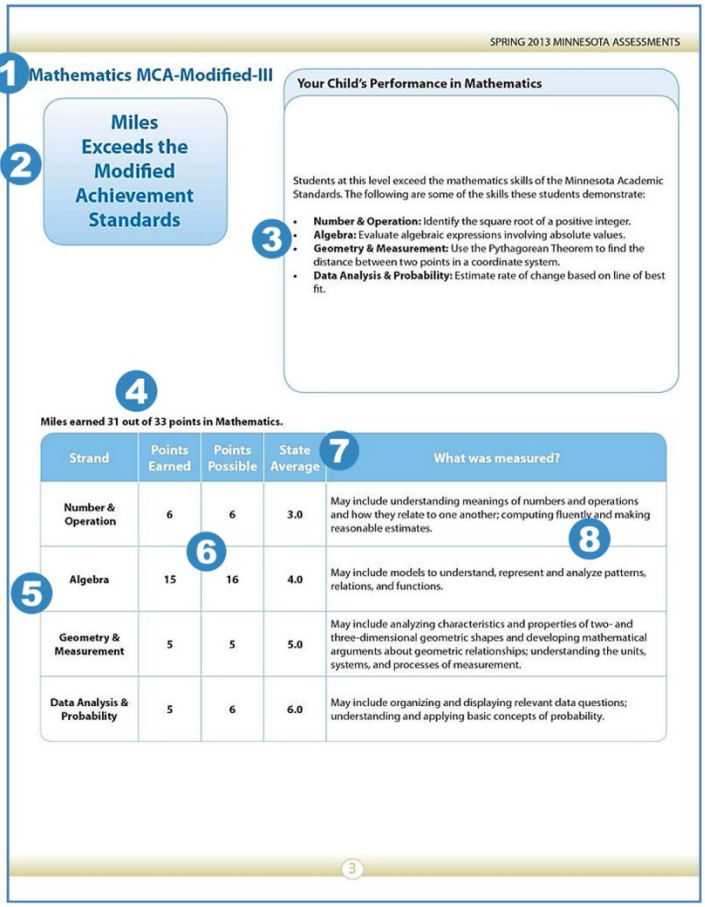
Student results for Science MCA will appear on a separate Individual Student Report.



Reading and Mathematics MCA Sample Individual Student Report – Pages 2 and 3

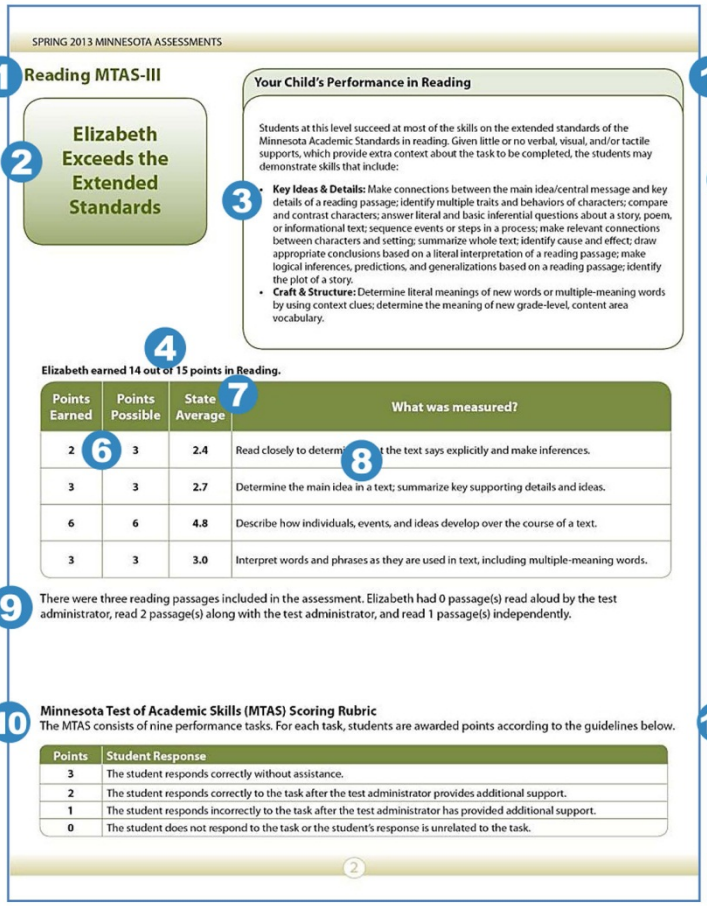
1. **Subject and Test** – The subject and test being reported.
2. **Student's Achievement** – The achievement level earned by the student in the subject.
3. **Achievement Level Description** – A summary of the expected knowledge and skills of the typical Minnesota student scoring at the achievement level identified. These descriptors are unique for each grade, subject, and achievement level.
4. **Score Analysis by Strand** – A description of the interpretations of sub-scores.
5. **Sub-Scores** – The strands or sub-strands from the Minnesota Academic Standards.
6. **Scale Score** – A scale score is a conversion of a student's raw score that equalizes possible differences in test form difficulty.
7. **Scale Score Range** – This section graphically shows the student's score and a band of uncertainty around their score.
8. **Percentile Rank** – A comparison among other students who took this test.
9. **Lexile© Measure** – The predicted Lexile measure of a student reading ability and upper and lower range that helps match a reader with literature appropriate for their reading skills. Available for Reading MCA only.
10. **Subject Progress** – A graphical representation of a student's progress from grade to grade. Student scores at or above the blue line indicate student performance is meeting or exceeding the standards. Student scores below the blue line indicate student's performance is not meeting standards. Progress scores are not reported for science.

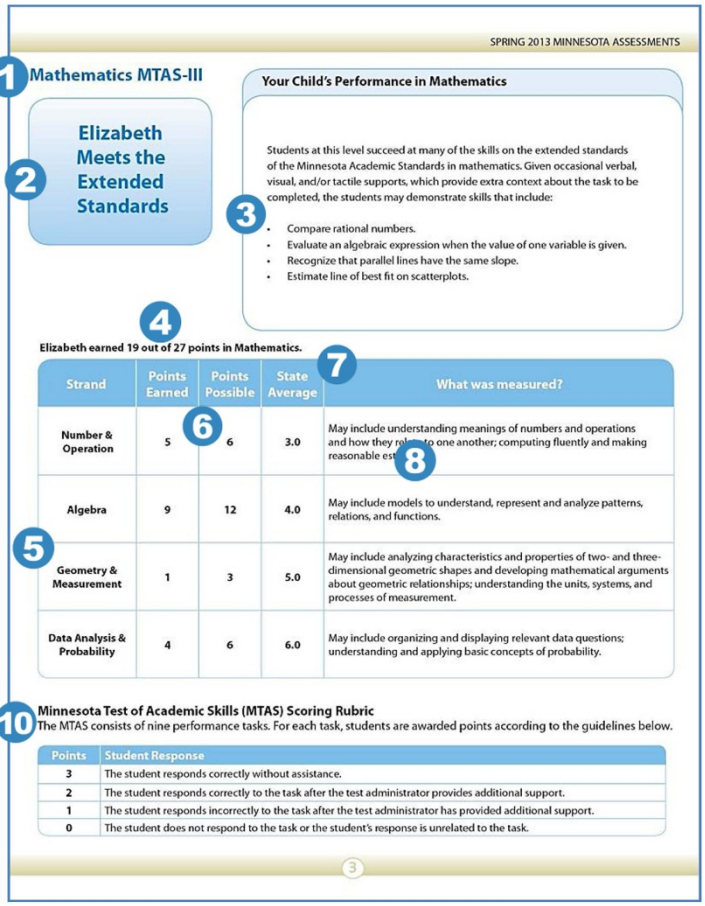




MCA-Modified Sample Individual Student Report – Pages 2 and 3

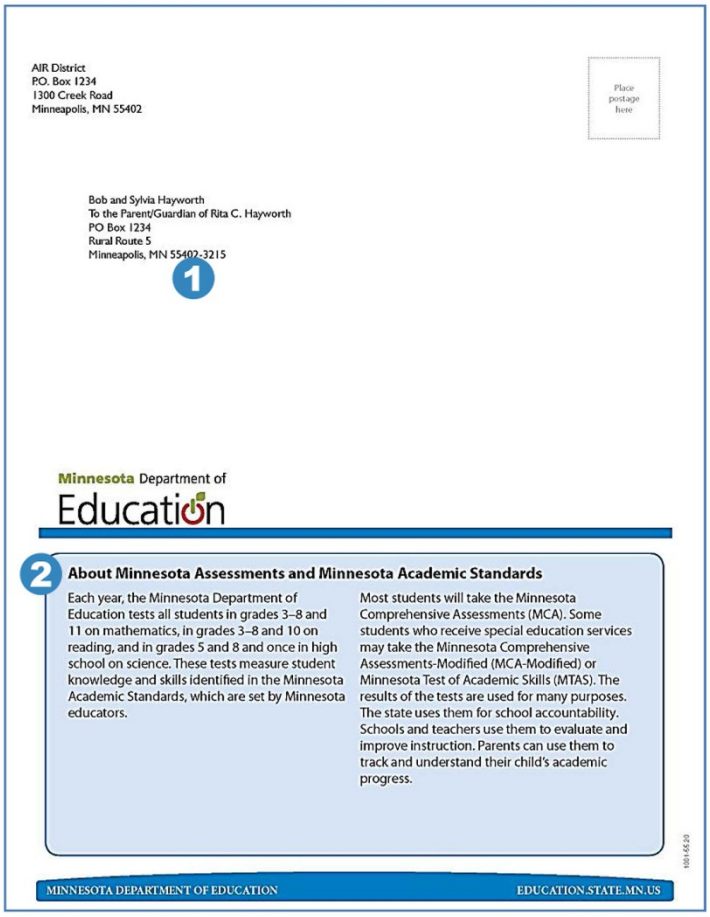
1. **Subject and Test** – The subject and test being reported.
2. **Student's Achievement** – The achievement level earned by the student in the subject.
3. **Achievement Level Description** – A summary of the expected knowledge and skills of the typical Minnesota student scoring at the modified achievement level identified. These descriptors are unique for each grade, subject, and achievement level.
4. **Total Points Earned** – The total points earned out of the total points on the test.
5. **Sub-Scores** – The strands or sub-strands from the Minnesota Academic Standards.
6. **Sub-Scores Points Earned and Points Possible** – The points the student earned and the number of possible points for each strand or sub-strand.
7. **State Average** – The average number of points earned for all students tested in the state.
8. **What Was Measured?** – A brief description of what is being assessed by each of the strands or sub-strands of the Minnesota Academic Standards.





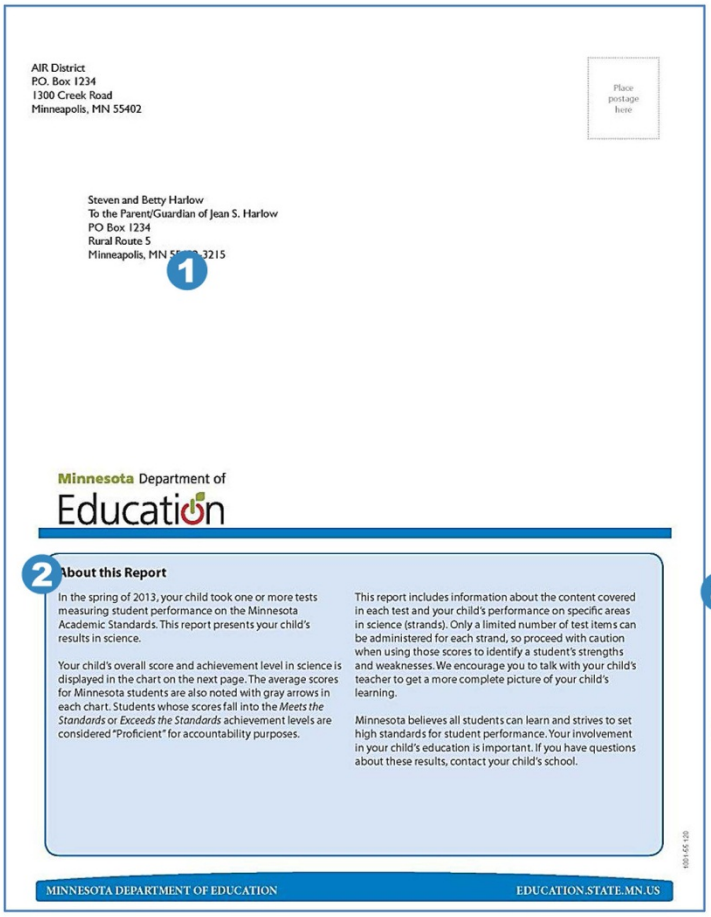
MTAS Sample Individual Student Report – Pages 2 and 3

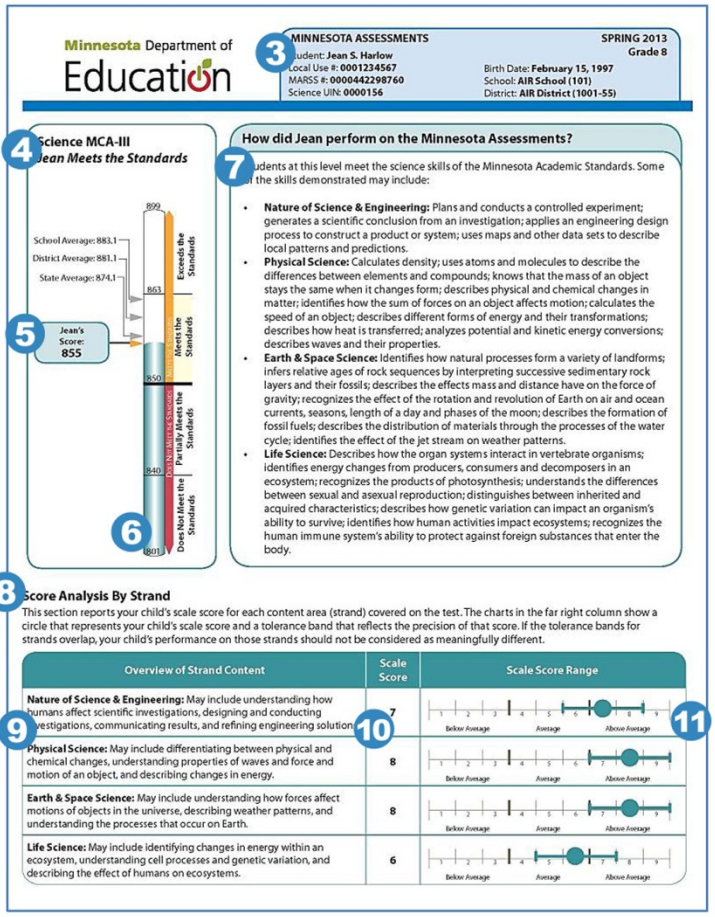
1. **Subject and Test** – The subject and test being reported.
2. **Student's Achievement** – The achievement level earned by the student in the subject.
3. **Achievement Level Description** – A summary of the expected knowledge and skills of the typical Minnesota student scoring at the achievement level identified. These descriptors are unique for each grade, subject, and achievement level.
4. **Total Points Earned** – The total points earned out of the total points on the test.
5. **Sub-Scores** – The strands or extended benchmarks from the Minnesota Academic Standards.
6. **Sub-Scores Points Earned and Points Possible** – The points the student earned and the number of possible points for each strand or extended benchmark.
7. **State Average** – The average number of points earned for all students tested in the state.
8. **What Was Measured?** – A brief description of what is being assessed by each of the strands or sub-strands of the Minnesota Academic Standards.
9. **Reading Access** – During test administration, the test administrator indicates how the student accessed the reading passage. The choices available for each passage are: the passage was read independently by the student, the student read along with the test administrator, and the test administrator read the passage to the student.
10. **Scoring Rubric** – The 0–3 rubric used for scoring MTAS tasks.



Reading and Mathematics Sample Individual Student Report– Page 4

1. **Address Section** – The school can use this area to print an address for mailing the Student Report to the student's home. The school district return address has been pre-printed. The report must be tri-folded in order to take advantage of this section.
2. **Learn More Information** – This section contains an overview of the Minnesota Assessments and a link to the MDE website.





Science MCA Sample Individual Student Report – Pages 1 and 2

1. **Address Section** – The school can use this area to print an address for mailing the Student Report to the student's home. The school district return address has been pre-printed. The report must be tri-folded in order to take advantage of this section.
2. **About this Report –** A brief description of the assessment and a link to the MDE website.
3. **Student Demographic Information** – A description of the demographic information for the student, including: Student Name, Local Use # (optional number assigned by districts to aid in sorting data), MARSS Number (unique student number), UIN (unique identification number assigned by the vendor and MDE), Grade, Birth Date, School, District.
4. **Subject and Test** – The subject and test being reported.
5. **Student's Performance** – A graphical representation of the relationship between the achievement level and the scale score the student earned for the subject.
6. **Scale Score Range** – A scale score is a conversion of a student's raw score that equalizes possible differences in test difficulty from one year to the next.
7. **Achievement Level Description** – A summary of the expected knowledge and skills of the typical Minnesota student scoring at the achievement level identified. These descriptors are unique for each grade, subject, and achievement level.
8. **Score Analysis by Strand** – A description of the interpretations of sub-scores.
9. **Sub-Scores** – The strands or sub-strands from the Minnesota Academic Standards.
10. **Scale Score** – A scale score is a conversion of a student's raw score that equalizes possible differences in test form difficulty.
11. **Scale Score Range** – This section graphically shows the student's score and a band of uncertainty around their score.

Minnesota Department of Education

2 About this Report

In the spring of 2013, your child took one or more tests measuring student performance on the Minnesota Academic Standards. This report presents your child's results in science.

Your child's overall score and achievement level in science is displayed in the chart on the next page. The average scores for Minnesota students are also noted with gray arrows in each chart. Students whose scores fall into the *Meets the Standards* or *Exceeds the Standards* achievement levels are considered "Proficient" for accountability purposes.

This report includes information about the content covered in each test and your child's performance on specific areas in science (strands). Only a limited number of test items can be administered for each strand, so proceed with caution when using those scores to identify a student's strengths and weaknesses. We encourage you to talk with your child's teacher to get a more complete picture of your child's learning.

Minnesota believes all students can learn and strives to set high standards for student performance. Your involvement in your child's education is important. If you have questions about these results, contact your child's school.

MINNESOTA DEPARTMENT OF EDUCATION EDUCATION.STATE.MN.US

3 MINNESOTA ASSESSMENTS SPRING 2013
Grade 8
nt: Joan E. Collins
Use #: 0001234567
MARSS #: 0000442298760
Science UIN: 7832419
Birth Date: June 30, 1997
School: AIR School (101)
District: AIR District (1001-55)

4 Science MTAS-III
Joan Meets the Extended Standards

269
State Average: 216.5
234
200
190
55
Exceeds the Extended Standards
Meets the Extended Standards
Partially Meets the Extended Standards
Does Not Meet the Extended Standards
5 Joan's Score: 215
6

How did Joan perform on the Minnesota Assessments?

7

Students at this level succeed at many of the skills on the extended standards of the Minnesota Academic Standards in science. Given occasional verbal, visual, and/or tactile supports which provide extra context about the task to be completed, the students may demonstrate skills that include:

- Identify common engineered systems that benefit daily life.
- Recognize when matter has undergone a chemical change.
- Show that an object will move in the direction of an applied force.
- Understand that an object may change speed when a force is applied.
- Identify the effects of weathering, erosion, and deposition on landforms.
- Identify organs in the respiratory, circulatory, and digestive systems (e.g., lungs, stomach, heart).
- Understand that some organisms cause diseases in humans.

Joan earned 22 out of 27 points in Science.

8 Strand	Points Earned	9 Points Possible	10 State Average	11 What was measured?
Nature of Science & Engineering	6	6	5.3	May include identifying common engineered systems, how people use them, and ways they benefit daily life.
Physical Science	6	9	6.5	May include identifying states of matter, recognizing when matter has undergone a physical or chemical change, and understanding how different forces (e.g., gravity, friction, pushes, pulls) affect the speed and direction of objects.
Earth & Space Science	4	6	4.4	May include understanding that landforms can change and identifying the effects of weathering, erosion, and deposition on landforms over time.
Life Science	6	6	4.9	May include identifying and understanding the functions of organs in the respiratory, circulatory, and digestive systems (e.g., lungs, heart, stomach) and understanding that some organisms cause diseases in humans.

Science MTAS Sample Individual Student Report – Pages 1 and 2

1. **Address Section** – The school can use this area to print an address for mailing the Student Report to the student's home. The school district return address has been pre-printed. The report must be tri-folded in order to take advantage of this section.
2. **About this Report** – A brief description of the assessment and a link to the MDE website.
3. **Student Demographic Information** – A description of the demographic information for the student, including: Student Name, Local Use # (optional number assigned by districts to aid in sorting data), MARSS Number (unique student number), UIN (unique identification number assigned by the vendor and MDE), Grade, Birth Date, School, District.
4. **Subject and Test** – The subject and test being reported.
5. **Student's Performance** - A graphical representation of the relationship between the achievement level and the scale score the student earned for the subject.
6. **Scale Score Range** – A scale score is a conversion of a student's raw score that equalizes possible differences in test difficulty from one year to the next.
7. **Achievement Level Description** – A summary of the expected knowledge and skills of the typical Minnesota student scoring at the achievement level identified. These descriptors are unique for each grade, subject, and achievement level.
8. **Sub-Scores** – The strands or extended benchmarks from the Minnesota Academic Standards.
9. **Sub-Scores Points Earned and Points Possible** – The points the student earned and the number of possible points for each strand or extended benchmark.
10. **State Average** – The average number of points earned for all students tested in the state.
11. **What Was Measured?** – A brief description of what is being assessed by each of the strands or sub-strands of the Minnesota Academic Standards.

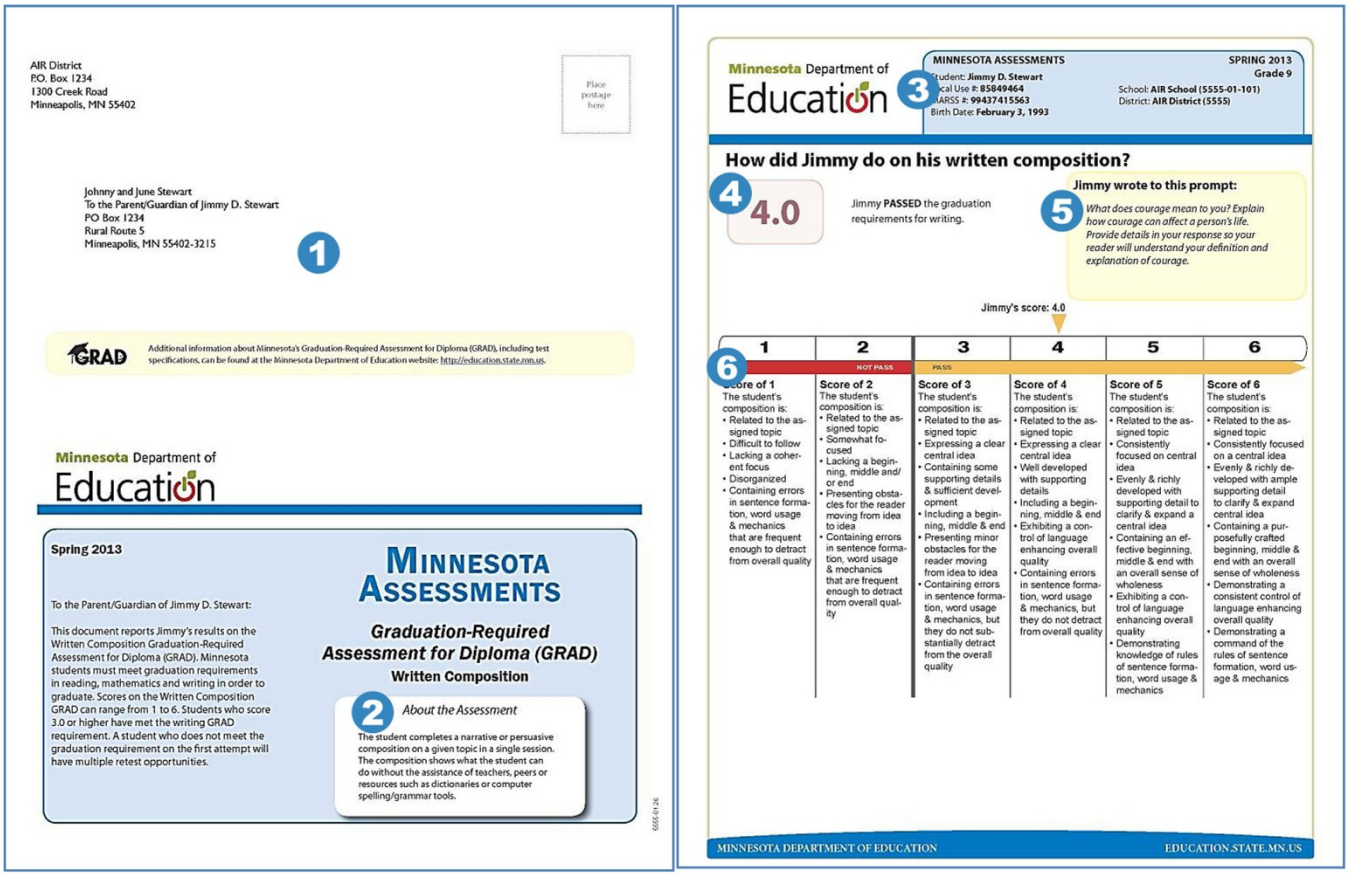
REPORT DESCRIPTIONS FOR ASSESSMENTS MEETING GRADUATION ASSESSMENT REQUIREMENTS

Minnesota students must satisfy graduation assessment requirements in order to graduate from a Minnesota public high school. As a result of legislation enacted in 2013, the graduation assessment requirements have changed from those indicated in the Individual Student Reports (ISRs). While the ISRs refer specifically to the GRAD requirements, students now have additional options to meet the graduation assessment requirements. Achieving proficiency on a high school Reading or Mathematics MCA, MCA-Modified, or MTAS, or passing the Written Composition GRAD and Reading and Mathematics GRAD retests are no longer the only ways to meet graduation assessment requirements.

General Description of the Written Composition GRAD Individual Student Report

An Individual Student Report (ISR) is generated for every student who took the assessment. Schools will receive a hard copy of each student's ISR to send home with the student or mail to the student's parent/guardian. Districts can also access final student-level information through the DSR and SSR files provided on the MDE website and an electronic copy of the student's essay through the Online Reporting System. The ISR describes an individual student's performance in terms of passing score.

The Minnesota Alternate Assessment: Writing is the alternate assessment for the Written Composition GRAD. To complete the Minnesota Alternate Assessment: Writing, the teacher evaluates the student on a set of writing attributes; grade 9 students who participate in this assessment will receive an ISR showing the average values for each attribute. View the Statewide Assessment for Students with Disabilities section of the MDE website for further information (http://education.state.mn.us/MDE/StuSuc/SpecEdProg/StateAssessStuDisab/index.html)



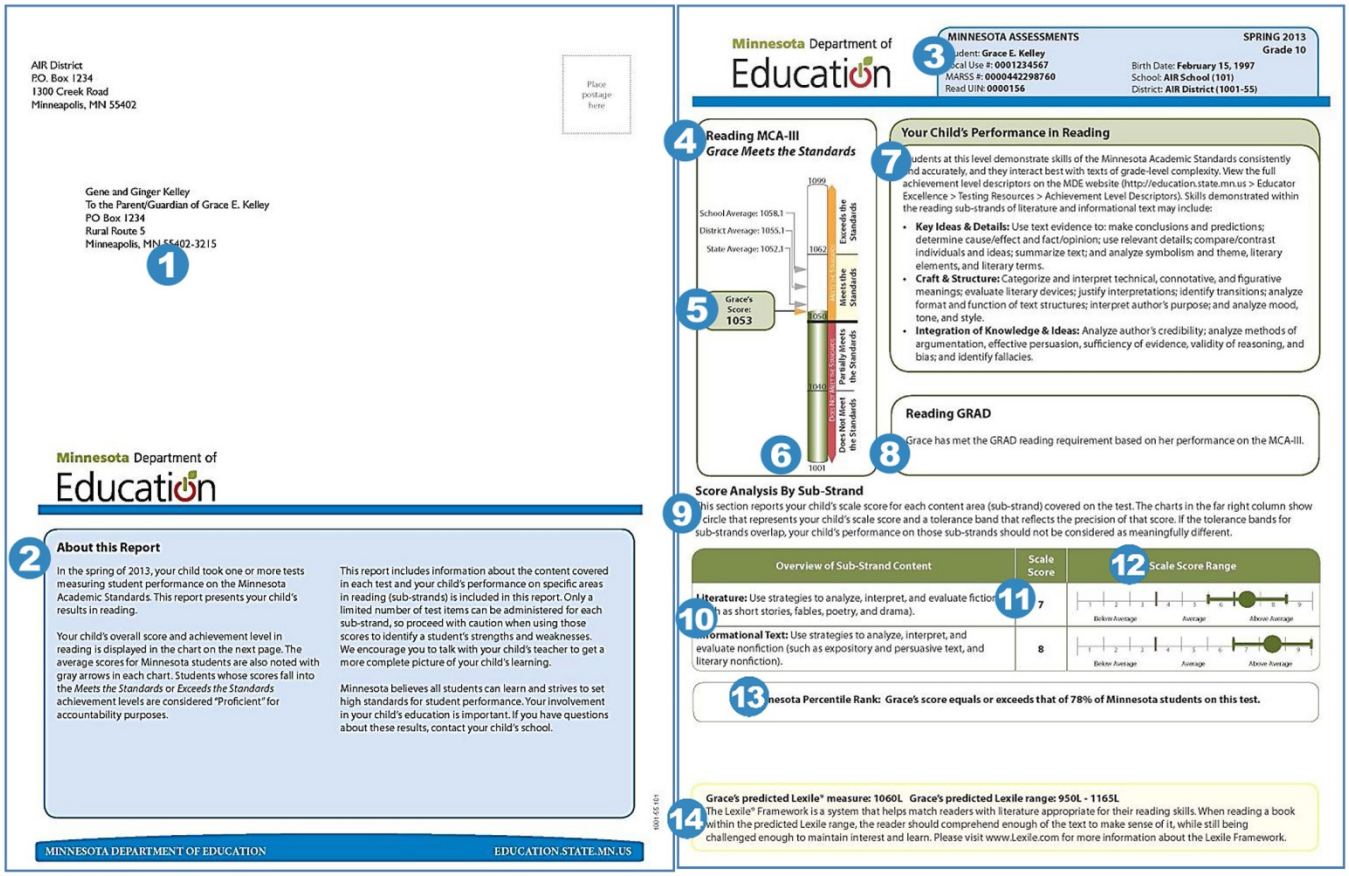
Description of the Written Composition GRAD Sample Individual Student Report – Front and Back Page

1. **Address Section** – The school can use this area to print an address for mailing the Individual Student Report to the student's home. The school district return address has been pre-printed. The report must be bi-folded to take advantage of this section.
2. **About the Assessment** – A brief description of the assessment.
3. **Student Demographic Information** – A description of the demographic information for the student, including: Student Name, Local Use # (optional number assigned by districts to aid in sorting data), MARSS Number (unique student number), UIN (unique identification number assigned by the vendor and MDE), Grade, Birth Date, School, and District.
4. **Student Score and Passing Status** – The performance level and passing status earned by the student in the subject.
5. **Prompt** – The prompt the student responded to for this assessment.
6. **Holistic Scoring Guidelines** – A graphical representation of the student's score and a description of each possible score point on the rubric.

General Description of the Grade 10 Reading MCA Individual Student Report

Students taking the grade 10 Reading MCA receive a single Individual Student Report (ISR). Because MCA Reading does not include an embedded GRAD component, students taking these assessments will receive only a GRAD status statement in addition to their MCA score.

Schools will receive a hard copy of each student's ISR to send home with the student or mail to the student's parent/guardian. Districts can also access final student-level information through the DSR and SSR files provided on the MDE Secured Reports website.



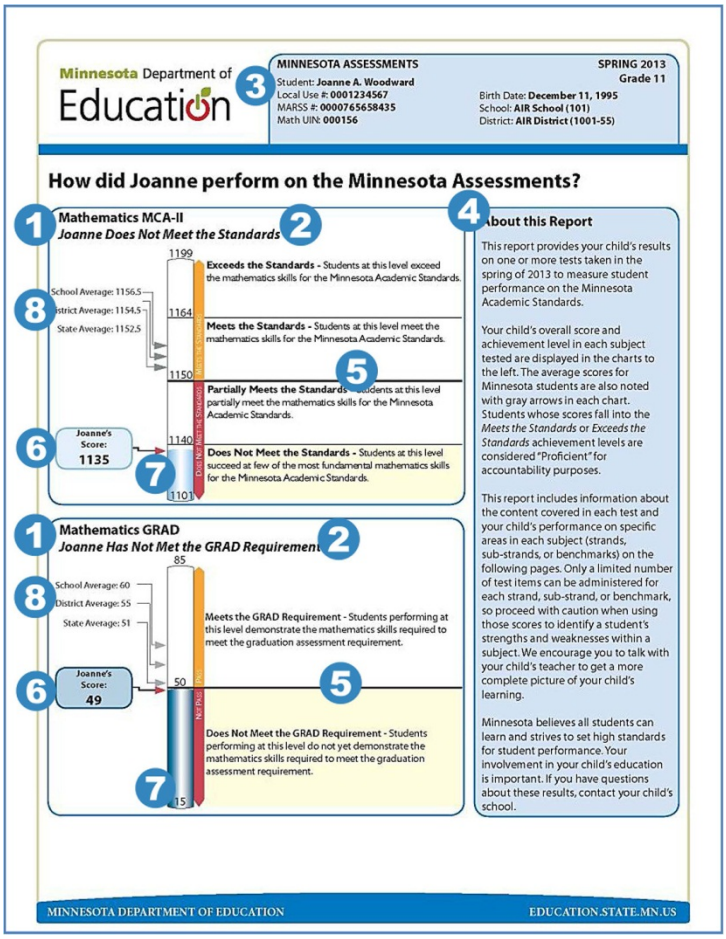
Description of the Grade 10 Reading Sample Individual Student Report – Front and Back Page

1. **Address Section** – The school can use this area to print an address for mailing the Student Report to the student's home. The school district return address has been pre-printed. The report must be tri-folded in order to take advantage of this section.
2. **About this Report** – A brief description of the assessment and a link to the MDE website.
3. **Student Demographic Information** – A description of the demographic information for the student, including: Student Name, Local Use # (optional number assigned by districts to aid in sorting data), MARSS Number (unique student number), UIN (unique identification number assigned by the vendor and MDE), Grade, Birth Date, School, District.
4. **Subject and Test** – The subject and test being reported.
5. **Student's Performance** - A graphical representation of the relationship between the achievement level and the scale score the student earned for the subject.
6. **Scale Score Range** – A scale score is a conversion of a student's raw score that equalizes possible differences in test difficulty from one year to the next.
7. **Achievement Level Description** – A summary of the expected knowledge and skills of the typical Minnesota student scoring at the achievement level identified. These descriptors are unique for each grade, subject, and achievement level.
8. **Student's GRAD Achievement** –A summary indicating whether the student has met the GRAD requirement for that subject.
9. **Score Analysis by Strand** – A description of the interpretations of sub-scores.
10. **Sub-Scores** – The strands or sub-strands from the Minnesota Academic Standards.
11. **Scale Score** – A scale score is a conversion of a student's raw score that equalizes possible differences in test form difficulty.
12. **Scale Score Range** – This section graphically shows the student's score and a band of uncertainty around their score.
13. **Percentile Rank** – A comparison among other students who took this test.
14. **Lexile© Measure** – The predicted Lexile measure and upper and lower range for the student. Available for MCA Reading only.

General Description of the Grade 11 Mathematics MCA Individual Student Report

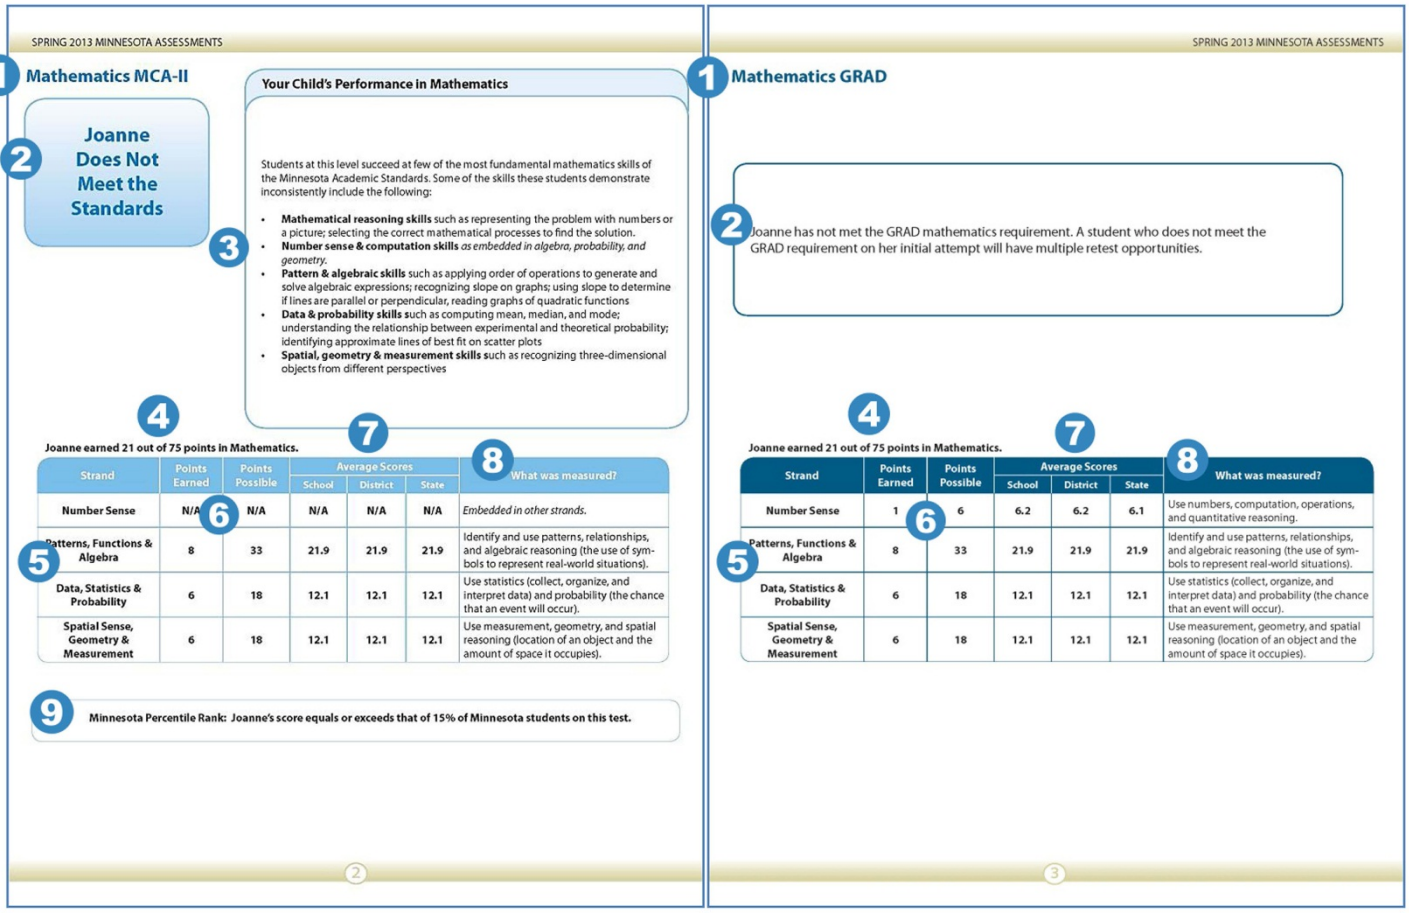
Students taking the grade 11 Mathematics MCA receive a single Individual Student Report (ISR) with the results from both the MCA and GRAD assessments as shown on the ISR below. For students who meet the GRAD requirement based on their MCA score, only their MCA scores will be reported. All students taking these assessments will see a GRAD status statement indicating whether they have met the GRAD requirement based on these assessments. Because the MTAS and MCA-Modified do not include an embedded GRAD component, students taking these assessments will receive only a GRAD status statement in addition to their MTAS or MCA-Modified score.

Schools will receive a hard copy of each student's ISR to send home with the student or mail to the student's parent/guardian. Districts can also access final student-level information through the DSR and SSR files provided on the MDE website.



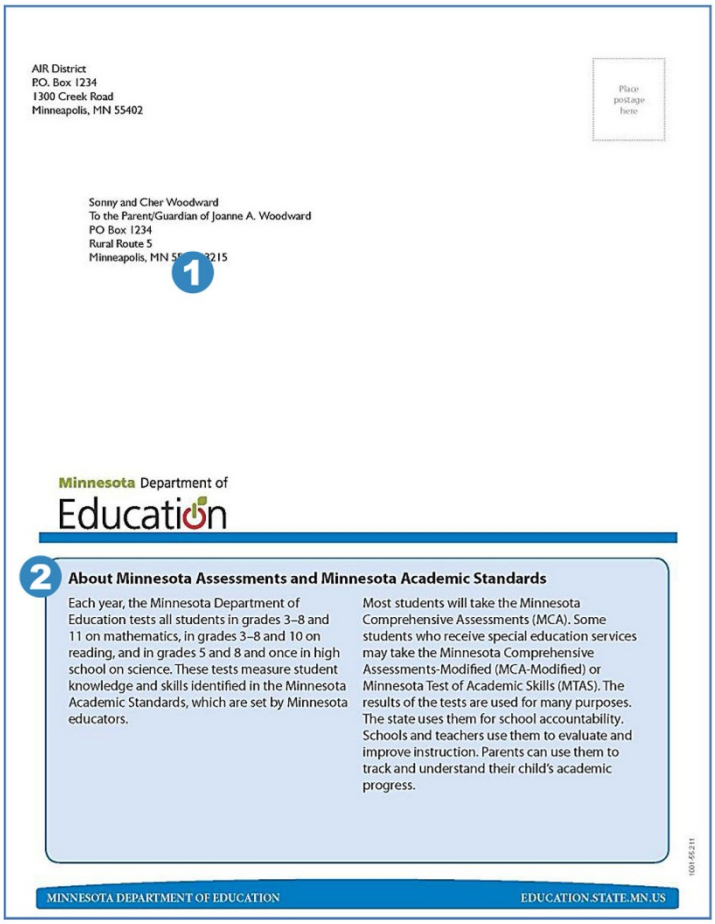
Description of the Grade 11 Mathematics Sample Individual Student Report – Page 1

1. **Subject and Test** – The subject and test being reported.
2. **Student's Achievement Level** – The achievement level earned by the student in the subject.
3. **Student Demographic Information** – A description of the demographic information for the student, including: Student Name, Local Use # (optional number assigned by districts to aid in sorting data), MARSS Number (unique student number), UIN (unique identification number assigned by the vendor and MDE), Grade, Birth Date, School, District.
4. **About this Report** – A brief description of the assessment.
5. **Achievement Levels** – A student can achieve one of four levels for each subject: Exceeds the Standards, Meets the Standards, Partially Meets the Standards, or Does Not Meet the Standards.
6. **Student's Performance** - A graphical representation of the relationship between the achievement level and the scale score the student earned for the subject.
7. **Scale Score Range** – A scale score is a conversion of a student's raw score that equalizes possible differences in test difficulty from one year to the next.
8. **School, District, and State Comparison** – This section graphically shows the average scale score for all tested students in the school, district, and state. It provides a quick comparison of the student's performance to reference groups. MTAS and MCA-Modified averages are reported only at the state level.



Grade 11 Mathematics Sample Individual Student Report – Pages 2 and 3

1. **Subject and Test** – The subject and test being reported.
2. **Student's Achievement** – The achievement level earned by the student in the subject. Page 3 indicates whether the student has met the GRAD requirement for that subject.
3. **Achievement Level Description** – A summary of the expected knowledge and skills of the typical Minnesota student scoring at the modified achievement level identified. These descriptors are unique for each grade, subject, and achievement level.
4. **Total Points Earned** – The total points earned out of the total points on the test.
5. **Sub-Scores** – The strands or sub-strands from the Minnesota Academic Standards.
6. **Sub-Scores Points Earned and Points Possible** – The points the student earned and the number of possible points for each strand or sub- strand.
7. **Averages** – The average number of points earned for all students tested in the school, district, and state.
8. **What Was Measured?** – A brief description of what is being assessed by each of the strands or sub-strands of the Minnesota Academic Standards.
9. **Percentile Rank** – A comparison among other students who took this test.



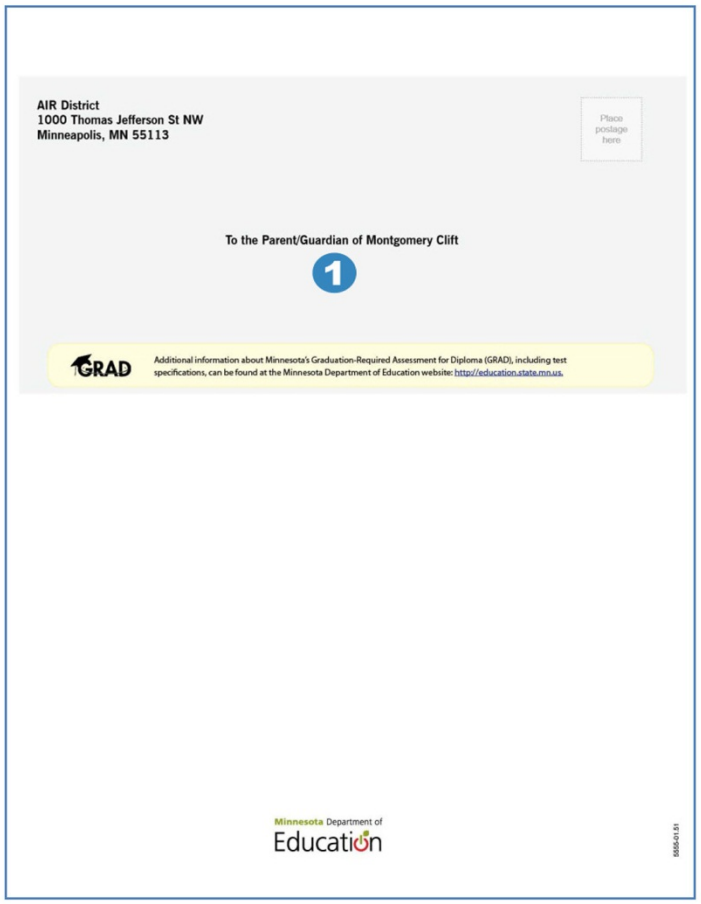
Grade 11 Mathematics Sample Individual Student Report – Page 4

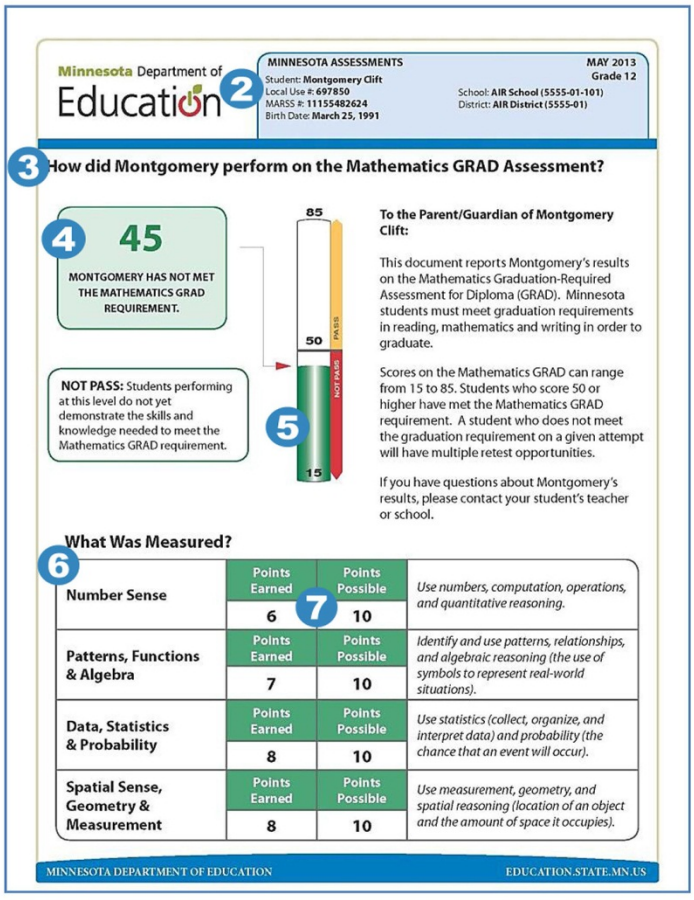
1. **Address Section** – The school can use this area to print an address for mailing the Student Report to the student's home. The school district return address has been pre-printed. The report must be tri-folded in order to take advantage of this section.
2. **Learn More Information** – This section contains an overview of the Minnesota Assessments and a link to the MDE website.

General Description of the Reading and Mathematics GRAD Individual Student Report

Students taking the Reading or Mathematics GRAD assessment receive a separate Individual Student Report (ISR) that will contain the tested subject's results. Schools will receive a hard copy of each student's ISR quarterly to send home with the student or mail to the student's parent/guardian. All students taking these assessments will see a GRAD status statement indicating whether they have met the GRAD requirement based on these assessments.

Electronic copies of student reports for GRAD retests can be printed from the Online Reporting System and shared with students and families to inform about graduation status. Districts can also access final student-level information through the DSR and SSR files provided on the MDE website.





Description of the GRAD Retests Sample Individual Student Report – Front and Back

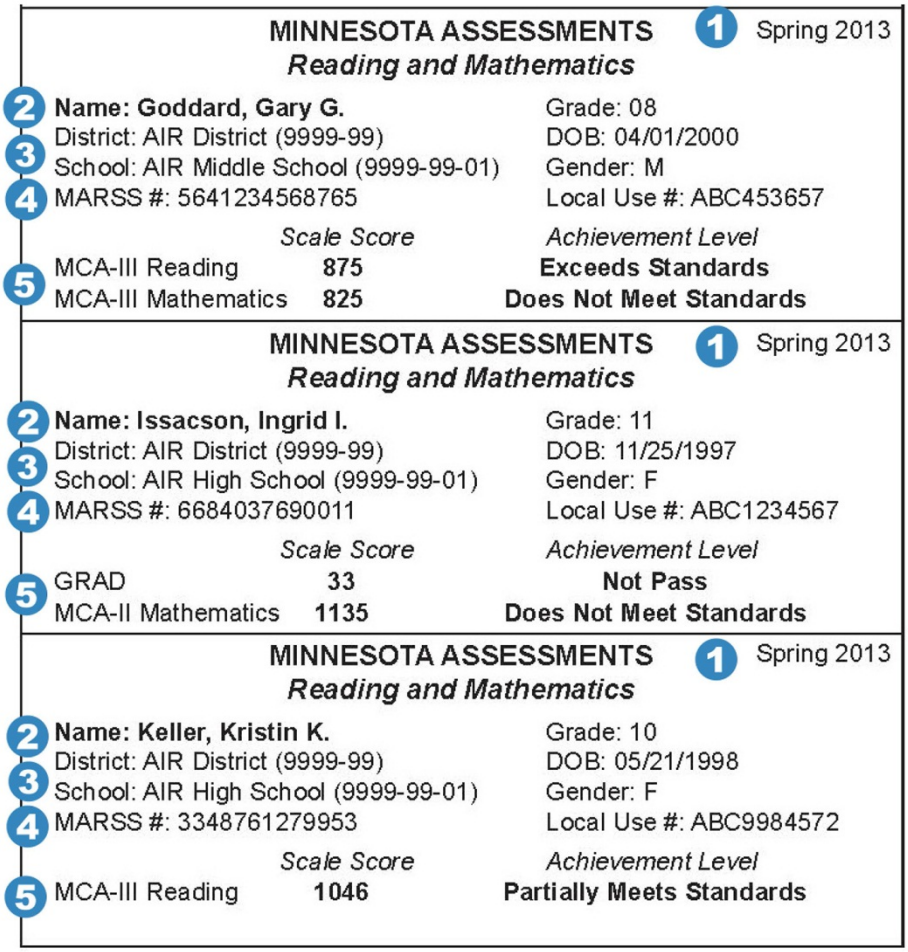
1. **Address Section** – The school can use this area to print an address for mailing the Individual Student Report to the student's home. The school district return address has been pre-printed. The report must be bi-folded to take advantage of this section.
2. **Student Demographic Information** – A description of the demographic information for the student, including: Student Name, Local Use # (optional number assigned by districts to aid in sorting data), MARSS Number (unique student number), UIN (unique identification number assigned by the vendor and MDE), Grade, Birth Date, School, District.
3. **Subject** – The subject being reported.
4. **Student Score and GRAD Passing Status** – The scale score and GRAD passing status earned by the student in the subject.
5. **Student's Performance** – A graphical representation of the relationship between the achievement level and the scale score the student earned for the subject.
6. **What Was Measured?** – A brief description of what is being assessed by each of the strands or sub-strands of the Minnesota Academic Standards.
7. **Sub-Scores Points Earned and Points Possible** – The points the student earned and the number of possible points for each strand or sub-strand.

STUDENT LABELS

General Description of the Student Labels

The student labels provide test score information for every student tested. These labels can be used on the student's hard-copy permanent file. Districts determine whether they want to receive student labels for Title I assessments. Student labels are automatically sent for the grade 9 Written Composition GRAD and GRAD retests.

Note: For Title I assessments, only grade 11 Mathematics MCA will include a GRAD score on the label. There is not an embedded GRAD component in any other assessment.



Description of the Sample Student Labels

1. Assessment, subject, and testing year.
2. Student name.
3. District and school where test was taken.
4. Student demographic data such as MARSS Number, Grade, Date of Birth, Gender, and Local Use ID.
5. Student's scale score and achievement level or pass status for each subject in the assessment; science and writing will each be on separate labels.

Yi Du	Psychometrician	A-117

Jon Cohen, Ph.D.

President, AIR Assessment

Education

Ph.D.	1992, Government (Methodology and American Politics) University of Texas at Austin, Austin, TX
M.A.	1988, Government (Methodology and American Politics) University of Texas at Austin, Austin, TX
B.A.	1985, Politics and Philosophy Bennington College, Bennington, VT

Present Position

Executive Vice President, AIR, and President, AIR Assessment Program, American Institutes for Research (AIR)

Responsible for all aspects of AIR's K–12 assessment program, with annual revenues of $100 million. As Chief Statistician, responsible for ensuring that AIR's statistical research contributes to our mission of improving society through better social and behavioral science. This entails responsibility for developing and evaluating new statistical procedures as well as the software to implement them.

Project Experience at AIR

Successfully directs the Assessment Program, responsible for all aspects of AIR's K–12 assessment program, with annual revenues of $100 million (2004–Present), and for the statistical research of the program, as AIR's Chief Statistician (1998–Present). Director, Statistical Services for Secondary Analysis, NAEP, Dr. Cohen leads the development, distribution, and support of statistical software designed for the analysis of NAEP data (1999–Present). Director of Statistics and Psychometrics, National Assessment of Adult Literacy (1999–Present), this study utilizes a multistage sample design selected with unequal probabilities and a partially balanced, incomplete block matrix test design. Calibration of the assessment includes both traditional item response methods and a theory-driven multi-component model developed by Dr. Cohen. Study Director, Evaluation and Review of Statistical Methods Used in National Assessment of Educational Progress (NAEP) (2003–2004). Statistical and Psychometric Advisor, California High School Exit Exam (CAHSEE) (2000–2002). Study Director, Models of Total Survey Error (1996–2001). Project Director, Technical and Analytical Support for the Assessment Group of NCES (1996–2000).

Employment History

2012–Present	Executive Vice President, AIR, and President, AIR Assessment Program, AIR, Washington, DC
2004–2012	Senior Vice President and Director of Assessment Program, AIR, Washington, DC
1998–Present	Chief Statistician, AIR, Washington, DC
2003–2004	Director, Computer and Statistical Sciences Center, AIR, Washington, DC
1998–2004	Associate Director for Research, AIR, Washington, DC
1997–1998	Managing Associate/Senior Statistician, AIR, Washington, DC
1988–1997	Research Associate/Research Analyst/Senior Research Analyst, AIR, Washington, DC
1986–1988	Systems Analyst, Defense Research Technologies (DRT), Rockville, MD
1985–1988	Teaching Assistant, University of Texas at Austin, Austin, TX

Steve Kromer, B.B.A.

Chief Operating Officer, AIR Assessment

Education

B.B.A. 1985, Management Information Systems
University of Iowa, Des Moines, IA

Present Position

Chief Operating Officer, AIR Assessment, American Institutes for Research (AIR)
Responsible for building on and fulfilling AIR's goal of providing clients with customized assessments that measure student achievement against the state standards and provide meaningful score reports that can help students, parents, and educators address any area of student weakness. Manages and provides leadership to the Assessment Program with a primary focus on developing and maturing the operational policies and procedures of the business. Identifies and implements new systems and processes as needed to produce the quality results required in the high-stakes assessment industry. Communicates directly with all AIR clients.

Project Experience at AIR

Successfully manages and provides leadership to AIR's Assessment Program with a primary focus on developing and maturing the operational policies and procedures of the business as the Chief Operating Officer of Assessment (2006–Present).

Employment History

2012–Present	Chief Operating Officer, AIR Assessment, AIR, Washington, DC
2006–2012	Executive Director of Operations, AIR, Washington, DC
1985–2006	Pearson Educational Measurement, Iowa City, IA
	Executive Vice President and General Manager (2003–2006)
	Vice President and General Manager (2000–2003)
	Director, Operations (1998–2000)
	Account Executive, Publisher Services (1994–1998)
	Manager State Assessments, Software Development (1989–1994)
	Analyst Programmer/Systems Analyst (1985–1989)

Heather Hayes, J.D.

Corporate Director, Online Testing

Education

J.D.	1996, College of Law University of Iowa, Des Moines, IA
B.A.	1992, English University of Iowa, Des Moines, IA

Present Position

Corporate Director, Online Testing, American Institutes for Research (AIR)
Responsible for documenting and transferring best practices in online, adaptive, full-year, multiple-administration testing from Oregon, Minnesota, and new state clients. Mentors project directors supporting Hawaii and Delaware.

Project Experience at AIR

Managed the Oregon Assessment of Knowledge and Skills (OAKS) Online, the first No Child Left Behind (NCLB)-approved online adaptive state assessment system. As the Senior Project Director, successfully provided approximately 5 million tests to more than 335,000 Oregon students in grades 3–12 in math, reading, science, and social science in a nine-month testing window for the OAKS Online Testing Program (2008–Present). Recently extended OAKS to support Oregon's Online Writing and Online English Language Proficiency Assessments (ELPA). Deployed the writing tests in the OAKS system; set up AIR's online distributed performance scoring system; and supported multiple in-state scoring sessions with groups of Oregon educators. Led the configuration and deployment of the ELPA in the OAKS system along with AIR's performance scoring system and AIR scorers.

Employment History

2008–Present	Corporate Director, Online Testing, AIR, Washington, DC
2003–2008	Senior Director/Director, Editorial and Content Development, United States Legal Markets, LexisNexis, Charlottesville, VA
2003–2006	Director, Online Annotated Statutes Project, LexisNexis, Charlottesville, VA
2000–2003	Editorial and Project Manager, Citations & Case Law, Editorial and Publishing Operations, North American Legal Markets, LexisNexis, Colorado Springs, CO
1999–2000	Senior Legal Editor, Case Law Enhancement Operations, LexisNexis, Colorado Springs, CO
1997–1999	Legal Analyst, Professional Publications, LexisNexis, Charlottesville, VA
1996–1997	Tax Examiner, Internal Revenue Service, Austin, TX

Dee Wagner, M.B.A.

Corporate Director, Operations

Education

M.B.A. 1993, Business Administration
Philadelphia University, Philadelphia, PA

B.S. 1980, Business Administration (Operations Management)
University of Delaware, Newark, DE

Professional Credentials and Certifications

International Organization for Standardization (ISO) Certified Lead Assessor, British Standards Institute, 2002

Six Sigma Black Belt (statistical process control to achieve total customer satisfaction in services as well as products), Six Sigma Research Institute, Motorola University, 2002

Present Position

Corporate Director, Operations, American Institutes for Research (AIR)

Oversees the work of 42 project management staff members and content, technical, score reporting, production, and operations team leaders. Manages multiple separate contracts for Ohio, covering summative assessments grades 3–8 and graduation tests in five subjects, Ohio's test of English Language Acquisition, Ohio's Alternate Assessments for Students with Disabilities, and other smaller efforts. Manages the activities of more than 80 staff and supervises the Columbus office, which runs on schedule and within budget and receives high client satisfaction. Ensures that test development staff meet deadlines. Works to restructure almost every aspect of the development process, including committee review procedures and staffing, bias reviews, rangefinding, and item development schedules. Manages subcontracts with AIR's operations partners and is intimately involved in test operations—from production to distribution—of regular and special versions. Personally led the redesign of the accommodations for testing in other languages, increasing the abilities of the state to test students and of AIR to deliver a high-quality product. Has developed business plans for score reporting, websites, and other new initiatives.

Project Experience at AIR

Currently oversees the work of AIR's content, technical, score reporting, production, and operations team leaders as the Corporate Director of Project Management (2003–Present). Successfully maintained responsibility for managing and overseeing all aspects of the Training and Technical Assistance Center for the Comprehensive Community Mental Health Services for Children and Their Families program as the Acting Project Director/Director of Operations (2001–2003). These responsibilities included working closely with the client, multiple program partners, and subcontractors to deliver relevant and timely technical assistance to 63 federally funded systems of care community sites. Managed and oversaw all logistical aspects of the School District of Philadelphia's Citywide Proficiency Exams as AIR's Director of Operations (2000–2001).

Employment History

2003–Present	Corporate Director, Operations, AIR, Washington, DC
2001–2003	Acting Project Director/Director of Operations, AIR, Washington, DC
2000–2001	Director of Operations, AIR, Washington, DC
1992–1994	Quality Performance Specialist, Asea Brown Boveri, Richmond, VA
1990–1992	Operations Analyst/Financial Controller, Asea Brown Boveri, Richmond, VA
1985–1990	Associate Program Director, Advanced Placement Program, Educational Testing Service, Princeton, NJ

Meredith Durgin, B.S.

Project Manager, Test Administration

Education

B.S. 1995, Elementary Education
University of Toledo, Toledo, Ohio

Present Position

Senior Project Manager, American Institutes for Research (AIR)

Responsible for managing statewide assessment contracts, including direct client contact, program communication, documentation and scheduling, on-time delivery of high-quality products and services, staff supervision, management of subcontractors, meeting facilitation, training and development, and other areas of planning and implementation necessary to ensure fulfillment of contract requirements. Oversees the planning and implementation of new initiatives to establish standards in project management and test development and operations processes.

Project Experience at AIR

Manages Oregon's very successful online testing project (2012–Present) and serves as Senior Project Manager to the Ohio Administrative Knowledge System (OAKS) Online Assessment (2012–Present).

Employment History

2012–Present	Senior Project Manager, AIR, Chicago, IL
2010–2012	Senior Program Manager, Questar Assessment, Inc., Minneapolis, MN
2002–2010	Senior Program Manager, Houghton Mifflin Harcourt, Boston, MA
1999–2002	Operations/Marketing Manager, COIN Educational Products, Toledo, OH

Kevin Murphy, M.A., PMP
Senior Program Manager

Education

M.A.	1999, Secondary Education CUNY–Hunter College, New York, NY
B.A.	1994, International Relations; International Business Lehigh University, Bethlehem, PA

Professional Credentials and Certifications

Project Management Professional (PMP), Project Management Institute, 2008

New York State Teacher Certification, Social Studies, Grades 7–12, 1999

Present Position

Director, State Programs, American Institutes for Research (AIR)
Responsible for managing statewide assessment contracts, including direct client contact, program communication, documentation and scheduling, on-time delivery of high-quality products and services, staff supervision, management of subcontractors, meeting facilitation, training and development, and other areas of planning and implementation necessary to ensure fulfillment of contract requirements. Oversees the planning and implementation of new initiatives to establish standards in project management and test development and operations processes.

Project Experience at AIR

Successfully managed all aspects of assessment contracts for the paper-and-pencil testing program for 800,000 students in the Ohio Achievement Assessments (2004–2007), the transition from paper-and-pencil testing programs to 100% online in Hawaii and Delaware (2008–2011), and Minnesota's dual-mode program (2011–2013). Served as Project Director for Chicago Public School's High School Transformation Project (2008) and the Chicago Public School's Social and Emotional Learning Project (2005–2006).

Employment History

2008–Present	Director, State Programs, AIR, Washington DC
2007–2008	Program Manager, McGraw-Hill/The Grow Network, New York, NY
2004–2007	Senior Operations Specialist, AIR, Washington, DC
2001–2004	Education Research and Evaluation Consultant, North Carolina Testing Program (North Carolina Department of Public Instruction and North Carolina State University)
2000–2001	Teacher, Wake County Public Schools, North Carolina

Professional Affiliations

Institute for Educational Leadership (IEL)

Professional Presentations

Biggs, P., Murphy, K., Thomas, J., & Grammer, B. (2004, November). *Making wise decisions about participation in the statewide testing program—unlocking the mysteries of testing*. Paper presented at the 54th Conference on Exceptional Children/NC Department of Public Instruction, Greensboro, NC.

Cynthia Benis, B.S.
Help Desk Manager

Education

B.S. 1981, Marketing
The Ohio State University, Columbus, OH

Present Position

Help Desk Manager, American Institutes for Research (AIR)
Manages AIR's help desk knowledge bases, inquiry tracking systems, and telephone and electronic communications systems. Oversees full-day support across five time zones. Responsible for the recruitment, hiring, and daily activities of the AIR customer help desk staff. Trains, mentors, and coaches staff on all policies and procedures, including compliance with established service-level agreements. Provides direct oversight and management, using standard help desk metrics to manage work flow. Prepares customer service quality plans, surveys, and reports and creates call monitoring standards. Evaluates department performance and communicate daily operational activity to client and staff. Provides a technology-based help desk that responds to nontechnical users of AIR's testing systems. Ensures client agreements are met.

Project Experience at AIR

Leads help desk operations as the Help Desk Manager at the Ohio Department of Education for all state assessments (2008–Present); for the Oregon Assessment of Knowledge and Skills (OAKS), Oregon Department of Education (2008–Present); New Mexico Alternate Performance Assessment (NMAPA), New Mexico Public Education Department (2008–Present); South Carolina Alternate Assessment (SC-Alt), South Carolina Department of Education (2008–Present); Delaware Comprehensive Assessment System (DCAS) and Delaware Comprehensive Assessment System-Alternate 1 (DCAS-Alt1), Delaware Department of Education (2009–Present); Hawaii State Assessment (HSA) and Hawaii State Alternate Assessment (HSA-Alt), Hawaii Department of Education (2009–Present); Minnesota Comprehensive Assessments (MCA) and Minnesota Test of Academic Skills (MTAS), Minnesota Department of Education (2010–Present); and the Pilot and Field-Test Administration, Smarter Balanced Assessment Consortium (2011–Present).

Employment History

2008–Present	Help Desk Manager, AIR, Columbus, OH
2004–2007	Customer Service Team Manager, Employment Benefit Management Corporation, Dublin, OH
2001–2004	Customer Service Manager, CompManagement Health Systems, Dublin, OH
2000–2001	MIS Requirements Researcher, Netsmart Technologies, Dublin, OH
1998–2000	Customer Support Manager, Netsmart Technologies, Dublin, OH
1992–1998	Team Leader, MIS Support, Netsmart Technologies, Dublin, OH
1989–1992	Applications Analyst I, MIS Support, Netsmart Technologies, Dublin, OH

Tamonica Jackson

Administrative Assistant

Education

Coursework 1997–1989, Business Management
Morgan State University, Baltimore, MD

Present Position

Senior Conference Manager, Administrative Services, American Institutes for Research, (AIR)

Manages daily operations of conference staff. Provides oversight for conference department staff members in implementing conference support activities, such as managing and coordinating logistical, professional and administrative support. Responsible for the quality, efficiency, and productivity of services provided by the staff that supports contracts. Manages support for more than 50 meetings, special events, and conferences throughout the year with an attendance from 25 to 500+. Support includes directing and coordinating site search and selection. Support also including budget development and tracking, managing and coordinating logistical support, hotel and vendor negotiations, development and dissemination of promotional material and post meeting evaluations. Oversees and manages web registration, traveler reimbursement, and meeting and administrative support services.

Project Experience at AIR

More than 5 years experience in planning and managing conferences with AIR on statewide assessment projects in Hawaii, Delaware, and Minnesota. On these projects she is responsible for working directly with the clients, managing conference budget, hotel search and selection, contract negotiations, vendor negotiations, and travel arrangements and reimbursements.
Ms. Jackson plans and manages over 50 meetings per year for participants that range in size of 10–500, including TAC, test steering, test content (item and passage), fairness and sensitivity, rangefinding, rubric validation, data review, standard setting, contract management, and various advisory committees. Convenes assessment-related meetings in AIR offices, hotels, and conference facilities and assists with registration services, including name badges, tent cards, signs, and participant lists, and ensures the accuracy of custom and/or individualized packets.

Employment History

2003–Present	Senior Conference Manager, AIR, Silver Spring, MD
2002–2003	Project Manager, J W Associates
1999–2002	Senior Conference Manager, J W Associates
1998–1999	Conference Manager, Laurel Consulting Group
1996–1998	Conference/Exhibit Coordinator, Research Assessment Management
1994–1996	Conference/Council Relations Assistant, American Association of Community Colleges

Professional Affiliations

Society of Government Meeting Professionals (SGMP)
Professional Convention Management Association (PCMA)

Matthew Hirsch
Administrative Assistant

Education

Coursework 1995–1997, Electrical Engineering, Computer Science
University of Maryland, College Park, MD

Present Position

Project Associate, American Institutes for Research (AIR)
Supports the Senior Program Manager in all project management activities, including meeting agendas, minutes, and associated documentation. Supports integrated scheduling across all AIR teams and subcontractors and ensures that materials move to and from the client using established protocols. As an expert in AIR's student registration system from the project management perspective, works with the Senior Program Manager in reviewing specifications, responding to any district or school upload issues escalated to the Senior Program Manager, and monitoring orders for paper testing materials to ensure they are within expected quantities.

Project Experience at AIR

Assists the Senior Program Manager in all aspects of operations for Ohio's Graduation Tests (2009–Present). Assists in score reports projects with the creation of student standardized test reports for Ohio and Hawaii in support of No Child Left Behind (NCLB). Provides quality control for digital printing software programming and student test score data processing. Oversees on-site printing and delivery fulfillment operations at printing vendor (2011–Present). Assisted in the National Assessment of Educational Progress (NAEP) project with creation of a background question database for use by educational researchers; provided quality control of database entries; and verified accuracy of test data (2008–2011).

Employment History

2008–Present Project Associate, AIR, Washington, DC
1997–2007 Operations Manager, RadioShack, Rockville, MD

Gary Phillips, Ph.D.

Vice President and Chief Psychometrician

Education

Ph.D.	1983, Applied Statistics and Psychometrics University of Kentucky, Lexington, KY
M.S.	1977, School Psychology West Virginia College of Graduate Studies, Huntington, WV
B.A.	1971, Psychology and Philosophy West Virginia State College, Institute, WV

Present Position

Vice President and Chief Scientist, Psychometrics, American Institutes for Research (AIR)
Provides senior-level guidance on all statistical and psychometric techniques and procedures used in assessment activities, including item response theory calibrating and equating; classical statistical analysis; differential item functions (DIF); standard-setting, reliability, and validity studies; generalizability studies; item banking; distributional projections; and value-added studies involving hierarchical linear models and structural equation models.

Project Experience at AIR

As the Vice President and Chief Scientist, Psychometrics, Dr. Phillips provides senior-level guidance on all statistical and psychometric techniques and procedures used in assessment activities (2003–Present).

Employment History

2003–Present	Vice President and Chief Scientist, Psychometrics, AIR, Washington, DC
1999–2002	Acting Commissioner, National Center for Education Statistics, U.S. Department of Education
1998–1999	Deputy Commissioner, National Center for Education Statistics, U.S. Department of Education
1991–1997	Associate Commissioner, Education Assessment Division, National Center for Education Statistics, U.S. Department of Education
1986–1990	Branch Chief, Education Assessment Branch, U.S. Department of Education
1980–1986	Branch Chief, Research and Evaluation Branch, Maryland State Department of Education
1977–1983	Adjunct Instructor, West Virginia State College, West Virginia College of Graduate Studies, University of Kentucky, University of Maryland
1971–1975	Social Worker, Kanawha County Department of Welfare, Charleston, West Virginia

Selina Tolosa, M.B.A.

Corporate Director, Computer and Statistical Sciences Center

Education

M.B.A.	Strategic Management, Marketing and Public Policy Wharton School of Business, University of Pennsylvania, Philadelphia, PA
B.S.	Business Management (cum laude) Ateneo de Manila University, Quezon City, Philippines

Present Position

Corporate Director, Computer and Statistical Sciences Center (CSSC), Information Technology Administration Manager, American Institutes for Research (AIR)

Leads, manages, and supervises a software development team of 80 personnel for the Assessment Division. The team includes software engineers, web graphic designers, testers, project managers, system engineers, data analysts, and technical writers. Ensures all assessment software can effectively provide test development, online and paper-based services, and scoring and reporting of large-scale high-stakes assessments. These systems include the following: a web-based, secure Test Delivery System that administers fixed or computer-adaptive tests and scores them dynamically (supports Windows, Macs, and Linux platforms); machine-scorable constructed-response questions; a quality management system that automatically reviews each test before it is reported; a web-based learning management system that allows teachers and students to organize and use a wide range of curricular materials, including identifying learning prerequisites; web-based reports that provide immediate results at every level, track student progress, and tie testing back to learning; user registration system and web services that regularly extract student data from district and school systems; and an item banking system that enables test development and customized reviews and workflows.

Project Experience at AIR

Directs the CSSC and manages the Information Technology Administration (2007–Present). Successfully managed software development projects as the Senior Project Manager and Quality Assurance Lead for Computer and Statistical Sciences Center (2005–2007).

Employment History

2007–Present	Corporate Director, Computer and Statistical Sciences Center (CSSC), AIR, Washington, DC
2005–2007	Senior Assessment Management Specialist, Computer and Statistical Sciences Center (CSSC), AIR, Washington, DC
2003–2004	Director of Information Services, New American Schools, Alexandria, VA
2003–2004	Financial Officer, New American Schools, Alexandria, VA
2002–2003	Senior Associate, New American Schools, Alexandria, VA
2001	Summer Associate, Ball Foundation, Glen Ellyn, IL
1999–2000	Part-Time Professor, Ateneo de Manila University, Quezon City, Philippines

Professional Affiliations

Co-Chair, International Admissions Committee, Wharton School of Business, University of Pennsylvania (2001–2002)

Executive Editor, eBusiness Review, Wharton School of Business, University of Pennsylvania (2001–2002)

Pianist/Keyboardist, Wharton Follies, Wharton School of Business, University of Pennsylvania (2000–2002)

Technical Skills

Visual Basic, Ruby, Standard Query Language, Java, C

Stacy Tsakeris, M.B.A., PMP

Project Manager, Computer-Based Testing

Education

M.B.A. 2010, Business Administration
University of Maryland University College, Adelphi, MD

B.S. 2002, Computer Science and Engineering (Specializing in Information Systems)
The Ohio State University, Columbus, OH

Professional Credentials and Certifications

Project Management Professional (PMP), Project Management Institute, 2011

Present Position

Project Manager, Computer-Based Testing, American Institutes for Research (AIR)
Manages the quality control for the Smarter Balanced Assessment Consortium computer-based testing across all AIR systems for a consortium of 24 states. Plans, budgets, and tracks testing activities, as well as coordinates with AIR Software Project Managers and Software Engineers for student registration, test delivery, quality assurance, and related systems to ensure quality control. In addition, manages the documentation for the Open Source testing software that AIR is developing and delivering to the Open Source repository, which will be available to all Smarter Balanced states.

Additional Project Experience

Lead and coordinated efforts to upgrade the University of California's Research and Grants Program Office (RGPO) Grants Administration and Management software from Altum proposalCENTRAL & GRAIL to Altum Easygrants. This effort included streamlining workflows while reducing redundant data entry, manual calculations, and paper forms for RGPO staff and grant applicants. Managed the upgrade and enhancements to the Sheet Metal Occupational Health Institute Trust's (SMOHIT) Medical Screening Database system, which was used to facilitate asbestos testing for more than 250,000 building and trade union members (2011–2013).

Employment History

2013–Present Project Manager, Computer-Based Testing, AIR, Washington, DC
2011–2013 Project Manager, Compuware Corporation, McLean, VA
2006–2011 Senior Software Engineer/Analyst, Legal & General America, Frederick, MD
2003–2006 Advanced Computer Developer/Analyst, Lynchval Systems Worldwide, Chantilly, VA

Technical Skills

Computer Languages: Turbo Pascal, Fortran, Cobol, C, C++, HTML, SQL (DB2/Oracle/MS SQL/Sybase), Delphi, Visual Basic, .Net concepts, XML, ActiveX Controls, Crystal Reports, SSRS, SSIS. **Database Systems:** Models, languages, organization, design, integrity, integrating new software with Legacy Systems. **Operating Systems Experience:** Concepts, component-based software, computer architecture, object-oriented components and design, quality assurance testing. **Process-Oriented Improvement:** Six Sigma and Capability Maturity Model Integration. **Project Management & Development Tools:** CMMI Methodologies, MS Project, JIRA, TeamCity, Onehub, VersionOne, Basecamp, Installshield, PVCS Version Manager and Tracker, MS Project.

M.A.	2002, Computer Science The George Washington University, Washington, DC
B.A.	2000, Computer Science Mumbai University, Mumbai, India

Professional Credentials and Certifications

Project Management Professional (PMP), Project Management Institute (PMI), 2008

Present Position

Senior Technical Project Manager, American Institutes for Research (AIR)

For AIR's Assessment Program, manages the development of four different software products that form the basis for most of the software systems delivered by AIR, with each product customized for multiple projects used in different states. Collect requirements for each project from its stakeholders and negotiate important features for building the base products so that the systems designed are cost-effective and easily expandable. Lead the technical efforts to change the K–12 testing system for the schools in Oregon from paper-based to a computer-adaptive system that worked across multiple operating systems. Manage the development and implementation of AIR's Test Information Distribution Engine (TIDE) that provides administrators the tools to view, add, and manage users for administrative tasks associated with assessments; view and edit student demographic information and test settings; and manage orders for paper test materials.

Project Experience at AIR

Supports online systems to support assessment projects in Delaware (2009–Present), Hawaii (2007–Present), Minnesota (2010–Present), New Mexico (2007–Present), Ohio (2009–Present), Oregon (2007–Present), South Carolina (2007–Present), Utah (2012–Present), and the Smarter Balanced Assessment Consortium (2012–Present).

Employment History

2007–Present	Senior Technical Project Manager, AIR, Washington, DC
2004–2007	Project Lead, ISIS, Georgetown University Medical Center, Washington, DC
2003–2004	Software Engineer, Division of Telemedicine and Robotics, ISIS, Georgetown University Medical Center, Washington, DC
2002–2003	Game Programmer, Lyra Studios, Washington, DC
2002–2003	3-D Application Developer, Center for Prostate Disease Research, Bethesda, MD

Technical Skills

Programming: MS.NET 2.0, C#.Net, VB.Net, ASP.Net, C, C++, Java, J2EE, Perl, XML, XSLT, SOAP, SQL, Ajax, Atlas, JavaScript, OpenGL, DirectX, UML, KML, ESRI libraries, Python, MFC; **IDE:** Visual Studio.Net (for architects, developers, and testers), Emacs, Eclipse, Visual Perl; **Web Server:** IIS, Tomcat, .NET Web Services, SQLXML; **Methodologies:** MSF for Agile software development, eXtreme Programming (XP), Scrum; **GIS:** ESRI products (ArcIMS, ArcGIS, ArcSDE, Shapefiles), NASA, WorldWind, Google Maps, MapPoint, ObjectFX (SpatialFX); Databases: SQL Server 7.0/2000/2005, Oracle 8i/9i, SQL Express, MySQL; **Platforms:** Windows (all), RedHat and RealTime Linux, Solaris, SGI, Apple Macintosh

Anil Chevuri, B.E.

Senior Application Developer, Student Registration

Education

B.E. 2002, Electronics and Communication
Visvesvaraya Technological University, Karnataka, India

Professional Credentials and Certifications

Microsoft Certified Professional (70-315): Developing and implementing web applications with Microsoft® Visual C#™ .NET and Microsoft® Visual Studio® .NET

Microsoft Certified Professional (70-320): Developing XML web services and server components with Microsoft Visual C# .NET and the Microsoft .NET Framework

Present Position

Senior Application Developer, American Institutes for Research (AIR)
Provides technical design and analyzes different projects for paper and online testing. Works as part of a pre-processing system that performs all student data import, export, and analysis. Responsible for planning, designing, implementing, and deploying the databases across all clients, including the designing, implementing, and deploying of data input/output collection services and websites using Visual studio 2012 ASP.net/C#/SQL 2005/2008 for both systems and maintaining the data integrity during extraction, manipulation, processing, analysis, and storage. Responsible for preparing the deployment documents and assisting with deployment of all projects from staging to production environment. Assists with preparation and execution of test cases.

Project Experience at AIR

Works on AIR's Roster Tracking Systems (RTS), Common Login System (CLS/OpenAM), and material ordering system (TIDE). Involved in requirement gathering for RTS and TIDE database and website (2007–Present).

Employment History

2007–Present Senior Application Developer, AIR, Washington, DC
2006–2007 Software Engineer, Tellabs, Naperville, IL
2003–2006 Programmer, VisualSoft, Motorola/Brinks System, Hyderabad, India
2002–2003 Programmer, Prakasha Arts, Hyderabad, India

Technical Skills

.Net: .NET Framework 1.1, 2.0, and 3.5; ASP.NET; Web Services (SOA); Windows Forms; ADO.NET; Remoting; Silverlight. **Languages:** C#, VB.NET, C, Visual Basic 6.0/5.0, SQL, T-SQL, Java. **Server-Side Programming:** ASP.NET, BizTalk, ASP. **Web Technologies:** XML, XSLT, XPATH, HTML, DHTML, CSS. **Scripting:** JavaScript, JQuery. **Databases:** SQL Server 2000/2005/2008, ORACLE 8i/9i. **Tools:** Redgate SQL compare, Redgate Data compare, SQL prompt, Visio, Photoshop, Microsoft FrontPage, Macromedia Dreamweaver Ultradev, Jetbrain profiler. **Distributed System:** Web Services, Sockets. **Development Environment:** Microsoft Visual Studio .NET 2003, Visual Studio .NET 2005, Visual Studio .NET 2008. **Documentation Tools:** Visio, NDoc, MS Office. Version Control Systems: Visual Source Safe, PVCS, WINCVS.

B.E.	2001, Electronics and Telecommunications University of Mumbai, Mumbai, India

Present Position

Senior Application Developer, Online Reporting System, American Institutes for Research (AIR)
Works with the development of the Online Reporting System, which is a web-based application providing student assessment reports to states, districts, schools, and teachers. Created the software library using C#.NET 2.0 to support a complex web-based reporting application created using ASP.NET 2.0, using C#.NET, and Microsoft SQL Server 2005.

Project Experience at AIR

As the Senior Software Engineer, responsible for debugging, making upgrades, and maintaining the application code and database to the Test Information Distribution Engine (TIDE) (2007–Present). As the Lead Software Engineer, works with a team of three developers to implement the redesigned solution of the Item Tracking System (ITS) (2008–Present).

Employment History

2007–Present	Senior Application Developer, Online Reporting System, AIR, Washington, DC
2003–2007	Lead Software Engineer, Blue Sky Factory, Inc., Baltimore, MD
2002	Software Engineer Intern, University of Maryland, Baltimore, Dental School, Baltimore, MD
2001–2003	Teaching Assistant, University of Maryland, Baltimore, MD

Technical Skills

Programming languages: Microsoft C# .NET, Visual Basic.NET, C, C++, Java. **Web technologies:** ASP.NET 2.0, ASP.NET 3.5, ASP.NET AJAX, AJAX, Macromedia ColdFusion 5/6.1/7, JavaScript, DHTML, CSS, XML, XML web services using ASP.NET, MATLAB. **Other technologies:** MATLAB, Adobe Photoshop, familiar with Macromedia/Adobe Flash. **Database:** Microsoft SQL Server, Microsoft Access, MySQL. Platforms: All Microsoft Windows platforms, Linux.

Jeremy Fisher, M.S.

Software Project Manager, Test Delivery

Education

M.S. 2009, Systems Development Management
Strayer University, Rockville, MD

B.S. 2006, Information Sciences and Technology
Pennsylvania State University, University Park, PA

Present Position

Technical Project Manager, American Institutes for Research (AIR)
Responsible for several major applications that facilitate online testing, including requirements gathering; creating and maintaining system documentation; help desk support; client coordination; facilitating platform item review; conducting onsite and offsite software demonstrations; creating and coordinating project schedules with project directors, team leads, and other staff; aiding the software development and testing; and integrating with other teams. Creates custom reports by developing and running database queries, assisting the developers and testers in uncovering system defects, coding in C#, and assisting the developers with bringing new system instances online. Conducts research on design principles and investigates new software to aid in the software development, testing, and management of the project. Delivers the Test Delivery System (TDS).

Project Experience at AIR

Supports online systems for assessment projects in Delaware (2009–Present), Hawaii (2007–Present), Minnesota (2010–Present), New Mexico (2007–Present), Ohio (2009–Present), Oregon (2007–Present), South Carolina (2007–Present), Utah (2012–Present), and the Smarter Balanced Assessment Consortium (2012–Present).

Employment History

2007–Present Technical Project Manager, AIR, Washington, DC

Aaron Newman, M.S.

Senior Application Developer, Test Delivery

Education

M.S. 1996, Electrical Engineering and Computer Science
University of Illinois at Chicago, Chicago, IL

B.A. 1990, Music
University of Wisconsin, Madison, WI

Present Position

Senior Application Developer Engineer, American Institutes for Research (AIR)
Manages an item development team. This team works with educators, graphic designers, database analysts, and other technical staff to coordinate creation, delivery, and scoring of assessment items.

Develops high-performance, cross-browser (including mobile) user interfaces for AIR assessments. Interfaces need to account for accessibility, including keyboard accessibility, text-to-speech, American Sign Language, visual impairments, and other special accommodations.

Develops and maintains a Student Geographical Distribution application, which allows transparent load balancing of assessments across multiple servers or geographical regions.

Employment History

2013–Present Senior Application Developer Engineer, AIR, Naperville, IL
1998–2012 Principal Engineer, Tellabs, Naperville, IL
1996–1998 Software Engineer, Tollgrade, Inc. (formerly Teradyne, Inc.), Deerfield, IL

Technical Skills

Programming: MS.NET 4.0, C#.Net, ASP.Net, C, C++, Java, Perl, XML, XSLT, SOAP, SQL, JavaScript, UML, Python, MFC. **IDE:** Visual Studio.Net (for architects, developers, and testers), Eclipse, IIS, Tomcat, .NET Web Services, SQLXML. **Methodologies:** MSF for Agile software development, eXtreme Programming (XP), Scrum; Fagan, PSP/TSP. **Databases:** SQL Server 7.0/2000/2005, SQL Express, MySQL. **Platforms:** Windows (all), RedHat and Ubuntu Linux, Solaris, Apple Macintosh, Android, IOS, WindRiver, OSE.

Brian Kane, Ph.D., PMP

Software Project Manager, Analysis Systems

Education

Ph.D.	1996, Astronomy Boston University, Boston, MA
M.A.	1990, Astronomy Boston University, Boston, MA
S.B.	1986, Mathematics and Physics College of William and Mary, Williamsburg, VA

Professional Credentials and Certifications

Project Management Professional (PMP), Project Management Institute (PMI), 2008

Honors and Awards

President's Quality Award, Indus Corporation, 2005

Present Position

Senior Technical Project Manager, American Institutes for Research (AIR)

For AIR's assessment program, manages a team of seven architects, developers, and testers supporting the scoring, quality control, reporting, and delivery of data from tests taken during online educational assessments. Responsibilities include operational and developmental management of projects with a total contract worth of $30 million; planning and coordinating with content developers and psychometricians; and analysis of functional, technical, and quality-driven system requirements. Provides expertise in mission-critical IT systems and full-cycle web software development for large, longitudinal data sets.

Project Experience at AIR

Supports online systems to support assessment projects in Delaware (2012–Present), Hawaii (2012–Present), Minnesota (2012–Present), New Mexico (2012–Present), Ohio (2012–Present), Oregon (2012–Present), South Carolina (2012–Present), Utah (2012–Present), and the Smarter Balanced Assessment Consortium (2012–Present).

Employment History

2012–Present	Senior Technical Project Manager, AIR, Washington, DC
2002–2012	Senior Technical Lead/Project Manager, Indus Corporation, Washington, DC
1997–2008	Nonprofit Owner and Developer, Astroplace, Inc., Washington, DC
2001–2005	Faculty Associate, Georgetown University, Washington, DC
2001–2002	Senior Systems Analyst, Signal Corporation, Washington, DC
1999–2001	Senior Developer, Tisani, Bethesda, MD

Professional Affiliations

Member, Project Management Institute (PMI)

Software Quality Assurance Lead

Education

M.S.	2001, Computer Science American University, Washington, DC
M.S. Certificate	2001, Applied Physics American University, Washington, DC
B.S.	1994, Mechanical Engineering University of Tirana, Tirana, Albania

Present Position

Senior Quality Control Specialist, Manager of Software Testing, CSSC, American Institutes for Research (AIR)

Leads and manages a 12-member Quality Assurance team through efficient and effective testing practices, which ensure that every system deployed meets specifications, functions, provides a satisfying user experience, and accurately captures or generates data. Also responsible for ensuring that assessment systems and statistical products delivered to clients are properly tested within the expected timeframes. Supports the efforts toward improving quality assurance and testing in all aspects of AIR's Computer and Statistical Sciences Center.

Employment History

2009–Present	Senior Quality Control Specialist, Manager of Software Testing, CSSC, AIR, Washington, DC
2005–2009	Senior Technical Risk Specialist, Test Automation Team Lead, Fannie Mae, Washington, DC
2004–2005	Senior Technical Risk Specialist, Backend Test Automation Team Lead, Fannie Mae, Washington, DC
2002–2004	IT Analyst, Backend Lead Tester/Automation Engineer, Fannie Mae, Washington, DC
2001–2002	IT Analyst, Backend Tester, Fannie Mae, Washington, DC

Technical Skills

Programming Language: Java. **Database Language:** SQL, PL/SQL, TSQL. **Scripting:** Perl, UNIX scripting. **Tools Scripting Languages:** TSL (WinRunner), VBScript (QTP).

Graham Tapscott
Network Engineer Lead

Education

B.S. (In Progress) Computer and Information Science
University of Maryland University College, Adelphi, MD

Present Position

Network Specialist, American Institutes for Research (AIR)
Responsible for the overall network and system engineering for the assessment division's web hosting environments. Additional responsibilities include system and network analysis, performance tuning, and application support for the Computing and Statistical Sciences group and its team of software developers, statisticians, and quality assurance specialists.

Project Experience at AIR

Serves as the primary system engineer for the initial and subsequent deployments of the Deployment and System Management of the Web-Based Test Delivery System (TDS) Platform (2008–Present). Responsible for building hardware specifications, system configuration, and performance tuning to support the transactional and bandwidth requirements that the senior computer scientists provide. As the Network Specialist, responsibilities include the overall network and system engineering for the Assessment division's web hosting environments (2004–Present).

Employment History

2004–Present Network Specialist, AIR, Washington, DC
2002–2004 Network Analyst II, Infopro Inc., Reston, VA
1999–2002 System Engineer, Legg Mason, Wood Walker, Baltimore, MD
1998–1999 Field Technician, US Communications, Annapolis, MD

Professional Affiliations

Usenix—System Administrator Special Interest Group (SAGE)

The League of Professional System Administrators (LOPSA)

Technical Skills

Software: Windows Server and UNIX/Linux System administration; Microsoft SQL and MySQL database administration; VB, PHP, Perl, C, C++, and C# programming; ASP.NET Web development environments; TCP/IP network administration/troubleshooting; Network/system design and documentation

Bani Dheer, J.D.
Corporate Director, Communications and Reporting

Education

J.D.	1995, Juris Doctorate University of British Columbia, Vancouver, BC
B.A.	1990, International Relations University of British Columbia, Vancouver, BC

Present Position

Corporate Director, Communications and Reporting, American Institutes for Research (AIR)
Oversees all AIR assessment activities related to the design, production, deployment, and delivery of paper and online score reports for the Minnesota Department of Education, Delaware Department of Education, Hawaii Department of Education, Oregon Department of Education, Ohio Department of Education, New Mexico Department of Education, and the South Carolina Department of Education. Built state of the art paper and online reporting capabilities for AIR's assessment program. Leveraged professional expertise in communications and market research to design, test, and refine data use and score reporting efforts with Department of Education officials to produce and distribute test score reports with evidence of impact on instruction. Scaled AIR's paper test score reporting capabilities from a single-district pilot in 2004 to seven large-scale assessment programs in 2008. Integrated paper reporting function with online reporting capabilities in one-and-a-half years. Managed operations involving designing and delivering more than 30 million pages of full-color score reports with variable text and graphics intended to drive changes in instruction for large-scale assessment programs.

Project Experience at AIR

Establishes and manages AIR's relationship with the Program for International Student Achievement (PISA) of the Organization for Economic Cooperation and Development (OECD) as the Director, International Benchmarking for State Assessments (2009–Present). Oversees the design, development, production, and delivery of family, class, school, and complex area reports for Hawaii Department of Education reports for grades 3–8 and 10 (2006–Present). Oversaw all deployments of the online reporting system for Delaware's Department of Education reports for grades 2–10 (2009). Oversaw production and delivery of score reports for Ohio's Alternate Assessment for Students with Disabilities (2004–2008), Ohio's assessment system for grades 3–8 (2004–2008), and Ohio's Graduation Test (2006–2009). Oversaw the design, development, production, and delivery of Chicago Public School's reports on learning environment (2006–2007) and South Carolina's reports for the End-of-Course (EOC) high school exit exam (2006–2007).

Employment History

2004–Present	Corporate Director, Communications and Reporting, AIR, Washington, DC
2002–2004	Senior Researcher, The Mellman Group, Washington, DC
2001–2004	Principal, Cook & Dheer, Vancouver, BC
2000–2001	Research Associate, The Strategic Counsel, Toronto, ON
1997–2000	Researcher/Consultant, d-Code, Inc., Toronto, ON

Selected Publications

Dheer, B. (1999, 2000). Research findings on youth consumer trends, Marketing.

Cathy Kugler, B.A.

Project Manager, Scoring and Reporting

Education

B.A. 2006, Psychology
University of Maryland, College Park, MD

Present Position

Statistical Support Associate, American Institutes for Research (AIR)
Provides research, development, and logistical support to senior psychometric staff in the Assessment program. Composes and edits technical reports, analysis specifications, and reporting documents related to the statistical integrity of standardized testing programs. Manages cross-project tasks and quality control efforts for multimillion-dollar state projects. Guides activities of junior statistical support staff.

Project Experience at AIR

Manages psychometric team schedules and deliverables for state assessments as a Psychometric team member. Responsibilities also include facilitating transition of technical item banks from previous testing contractor to AIR, developing quality control procedures for implementation of test administration and scoring systems for assessments, including the Minnesota Department of Education, Minnesota Assessment Program (2011–Present); Ohio Department of Education, (2006–Present); Ohio Graduation Test (2006–Present); Ohio Test of English Language Acquisition, (2006–Present); Ohio Alternate Assessments for Students with Disabilities (2006–Present); and Ohio Achievement Assessments (2006–Present). As a Research Assistant, provided support and assistance to AIR's Assessment division of Psychometricians and Statisticians by generating and producing materials for item review and standard-setting meetings. Provided support for data analysis programs. Performed quality assurance checks on analysis outputs, preparation and development of technical reports, and review of all field-test and operational-test forms (2006–2008).

Employment History

2008–Present Statistical Support Associate, AIR, Washington, DC
2006–2008 Research Assistant, AIR, Washington, DC

Marta Gebrehiwot, B.A.
Lead, Handscoring

Education

B.A. 2006, Economics, International Business and Management (magna cum laude)
Dickinson College, Carlisle, PA

Present Position

Score Reporting Project Coordinator, American Institutes for Research (AIR)
Manages score reporting projects from mockup development to report programming, testing, and production. Participates in weekly internal and external client meetings to discuss schedules and reporting specifications. Communicates client-requested reporting modifications to designers, statistical and graphical programmers, and print vendors. Identifies and implements process improvements in the production of score reports.

Project Experience at AIR

Manages score reporting projects from mockup development to report programming, testing, and production as the Score Reporting Project Coordinator for assessments including the South Carolina Alternate Assessment (2010–Present), New Mexico Alternate Assessment (2010–Present), and Delaware State Assessments (2011–Present). As a Research Assistant responsibilities included conducting research through focus groups consisting of district test coordinators, principals, and teachers to identify improvements in the presentation of assessment data and information for the Hawaii Alternate Assessment (2012–2013), Ohio Alternate Assessment (2012–2013), Minnesota State Assessment (2011–2012), and the Cleveland CFT project (2010–2013).

Employment History

2012–Present Score Reporting Project Coordinator, AIR, Washington, DC
2009–2012 Research Assistant, AIR, Washington, DC
2007–2009 Learning Resource Center (LRC) Monitor, Strayer University, Washington, DC
2006–2007 Facilities Asset Analyst, Sightlines LLC, Guilford, CT
2005–2006 Marketing Contractor, Z-Band, Inc., Carlisle, PA
2004–2005 Office Assistant, Dickinson College, Library and Information Services (LIS), Carlisle, PA

Professional Affiliations

Omicron Delta Epsilon (Economics Honor Society)
Sigma Beta Delta (International Honor Society for Business, Management, and Administration)

Honors and Awards

Calderwood Writing Fellow, Calderwood Foundation, 2006–2007

Grant Recipient, Braitmeyer Foundation, 2000

Present Position

English Language Arts Test Development Specialist, American Institutes for Research (AIR)
Writes, reviews, and revises English language arts (ELA) test items based on their fairness and content. Resolves team and client feedback on test items at individual meetings and group review sessions. Helps senior staff recruit, train, and manage internal and external item writers. Drafts training materials for item writers. Assembles test item pools as directed by senior staff. Attends client committee meetings in which stakeholders review the fairness and content of test items.

Project Experience at AIR

Develops test items as the ELA Content Lead for the Smarter Balanced Assessment Consortium (2013–Present). ELA Item Developer for the Delaware Comprehensive Assessment (2012–2013). Assembled test items as the ELA Grade Lead for statewide assessments including Minnesota (2011–2012) and Hawaii (2012).

Employment History

2011–Present English Language Arts Test Development Specialist, AIR, Washington, DC
2003–2009 English Language Arts Teacher, John W. McCormack Middle School
1998–2002 Language Arts and Computer Science Teacher; Technology Director, The Girls' Middle School

Terry Hill, B.A.

Lead, English Language Arts Grades 3–5

Education

B.A. 1995, Professional English
North Carolina A&T State University, Greensboro, NC

Honors and Awards

Golden Key Honors Member, Golden Key International Honor's Society, 1992

Present Position

English Language Arts Test Development Specialist, American Institutes for Research (AIR)
Responsibilities include directing the development of various writing and modified projects. Selects reading passages and other stimuli, managing and editing items for various clients, using AIR's Item Bank System. Work with clients during item reviews, bias and sensitivity meetings, rangefinding, and standard-setting meetings. Provides feedback to item writers and in-house development staff and creates test forms.

Project Experience at AIR

Successfully develops English language arts (ELA) items for projects including the Minnesota–Modified (2013–Present), Utah Writing Assessment (2013–Present), and Hawaii State Assessment (2012–2013).

Additional Project Experience

As ELA Content Specialist at Measurement Incorporated (2010–2012), responsibilities included working with item writers for purposes of developing items for the Item Bank project, acting as the final reviewer of content of items, invoicing item writers, and writing passages and items for the Item Bank project. As the Editorial Assistant, responsible for leading projects for the Council of Chief State School Officers (CCSSO)/English Language Development Assessment (ELDA), the New Jersey Special Review Assessment (SRA), the New Jersey Biology performance assessment tasks (PATs), and the Michigan Educational Assessment Program (MEAP) for reading (2003–2010).

Employment History

2012–Present	English Language Arts Test Development Specialist, AIR, Washington, DC
2010–2012	ELA Content Specialist, Measurement Incorporated, Durham, NC
2003–2010	Editorial Assistant, Measurement Incorporated, Durham, NC
2001–2003	News Desk Editor, Total Sports/Quokka Sports, Raleigh, NC
1999–2001	Online Editor, Terra-Lycos
1995–1999	Technical Correspondent, Underwriters Laboratories, Washington, DC

Allison Stingley, M.A.E.

Lead, English Language Arts Grades 3–5

Education

M.A.E.	2006, Literature DePaul University, Chicago, IL
B.A.	2004, Secondary Education of English University of Illinois at Chicago, Chicago, IL

Professional Credentials and Certifications

Teaching Certificate, Secondary and Middle School

Present Position

English Language Arts Test Development Specialist, American Institutes for Research (AIR)
Assists in the development of English language arts (ELA) assessment items and stimuli. Responsibilities include writing, editing, and reviewing test items, providing feedback to item writers, resolving client feedback issues, and meeting with clients for test item reviews.

Project Experience at AIR

Writes, edits, and reviews ELA items as the Test Development Specialist for Utah State Assessments (2013–Present) and Hawaii State Assessments and End-of-Course (EOC) Assessments (2012–Present). Successfully developed ELA items for Learning Point Navigator (2013), Minnesota State Assessments (2011–2013), and Ohio State Assessments (2011).

Additional Project Experience

Designed study plans, scope and sequence, and instruction as Pearson's Editor for onTarget ELA Database Phases 1 and 2. Edited and wrote manuscript and metadata for all grade-levels. Worked with CCST-based instruction for literature, informational text, speaking and listening, and language (2010–2011). Editor, Texas ELA adoption for 2011 (2009–2010) and California ELA adoption for 2010 (2007–2009). Responsibilities included designing ELA curriculum that met all state standards; managing and advising a team of freelance writers; creating guidelines; editing manuscripts; and ensuring lessons were aligned with the states standards.

Employment History

2011–Present	English Language Arts Test Development Specialist, AIR, Chicago, IL
2006–2011	Editor, Pearson Education, Chicago, IL
2004–2005	Teacher, Cicero Public Schools, Chicago, IL
2003–2005	Writing Tutor, University of Illinois at Chicago and DePaul University, Chicago, IL

Allen Chong, M.Ed.

Lead, English Language Arts Grades 6–8

Education

M.Ed.	2010, Education and Human Development George Washington University, Washington, DC
B.A.	2008, Political Science Vassar College, Poughkeepsie, NY

Present Position

English Language Arts Test Development Associate, American Institutes for Research (AIR)
Assists in the development of K–12 English language arts (ELA) assessment items and stimuli. Responsibilities include writing and selecting passages and other stimuli; writing, editing, and reviewing test items; working with clients during item reviews and bias and sensitivity meetings; and responding to client feedback.

Project Experience at AIR

Writes, edits, and reviews ELA items as the Grade Level Lead for the Smarter Balanced Assessment Consortium (2013–Present). Successfully assisted in the test development of ELA items for Oregon's English Language Proficiency Assessment (2013), as well as Utah's state assessments (2013) and Minnesota's state assessments (2013).

Employment History

2013–Present	English Language Arts Test Development Associate, AIR, Washington, DC
2012–2013	Test Development Specialist, Center for Applied Linguistics, Washington, DC
2011–2012	Research Assistant, Center for Applied Linguistics, Washington, DC
2010–2011	Administrative Assistant, Early Head Start National Resource Center, Washington, DC
2008–2010	Teacher, District of Columbia Public Schools, Washington, DC

Chong, A., & Laya, G. (2013, February). *Midiendo éxito: El desarrollo y la aplicación de PODER*. Presented at meeting of National Association of Bilingual Educators (NABE), Lake Buena Vista, FL.

Meghan Mulhern, Ed.M.
Lead, English Language Arts Grades 6–8

Education

Ed.D. Candidate	Bilingual Special Education The George Washington University, Washington, DC
Ed.M.	2009, Language and Literacy Harvard Graduate School of Education, Cambridge, MA
B.A.	2006, Linguistics, Psychology (University Honors Program) University of Maryland, College Park, MD

Present Position

English Language Arts Test Development Associate, American Institutes for Research (AIR)
Assists in the development of K–12 English language arts (ELA) assessment items and stimuli. Responsible for selecting reading passages and other stimuli; writing, editing, and reviewing test items; working with clients during item reviews and bias and sensitivity meetings; and responding to client feedback.

Project Experience at AIR

Assists in the development of K–12 ELA assessment items and stimuli as the Test Development Associate for the Smarter Balanced Assessment Consortium (2012–Present), Hawaii State Assessment (2012–2013), and the Utah State Assessment (2013).

Employment History

2012–Present	English Language Arts Test Development Associate, AIR, Washington, DC
2011–2012	Visiting Assistant Professor, The George Washington University, Washington, DC
2009–2011	Project Coordinator, The George Washington University, Washington, DC
2009–2009	Research Assistant, The George Washington University, Washington, DC
2008–2009	Graduate Research Assistant, Harvard Graduate School of Education, Cambridge, MA
2006–2007	Paraeducator, Montgomery County Public Schools, College Park, MD

Professional Affiliations

American Educational Research Association
Council for Exceptional Children

Professional Presentations

Mulhern, M. (2011, February). V*ocabulary instruction for ELLs*. Invited guest lecturer for the graduate education course Teaching Second Language Reading and Writing, Prince George's County Public Schools, Riverdale, MD.

Mulhern, M., Llagas, C., & Mazur, A. (2012, April). *Teacher perceptions about their English language learners*. Paper presented at the Council for Exceptional Children Annual Conference, Denver, CO.

Llagas, C., Mulhern, M., & Mazur, A. (2012, April). *Teacher Perceptions and Practices of Text Adaptation*. Paper presented at the AERA Annual Meeting, Vancouver, BC.

Austin Buckley, B.A.

Lead, English Language Arts Grades 6–8

Education

B.A. 2010, English Language and Literature, Women's Studies
University of Maryland, College Park, MD

Present Position

English Language Arts Test Development Assistant, American Institutes for Research (AIR)
Creates and enters English language arts (ELA) passages, items, and classification information in test creation software; monitors item review schedules across testing programs; and checks item flow in test creation software. Additionally, prepares items for internal reviews and prepares review logs, item booklets, and ancillary materials for client committee meetings.

Project Experience at AIR

Serves as the ELA content lead for the Delaware Department of Education contract where she leads the development of ELA items and passages across grades 2–12 for Delaware Compressive Assessment Standards (2011–Present). Additionally, serves as Grade Level Lead for grades 4 and 5 for the Smarter Balanced Assessment Consortium listening development (2012–Present); serves as Grade Level Lead for grades 3 and 4 of internal Common Core State Standards (CCSS) development (2012–Present); and contributes to Hawaii End-of-Course (EOC) development for Expository Writing (2011–Present).

Employment History

2011–Present English Language Arts Test Development Assistant, AIR, Washington, DC
2009–2011 Legal Clerk, U.S. Department of Justice, Aviation and Admiralty Litigation
2007–2009 Human Resources Associate, Flippo Construction Company, Inc.

Mark Lovely, M.F.A.

Lead, English Language Arts High School

Education

M.F.A.	1997, Fiction Writing University of Iowa, Iowa City, IA
B.A.	1991, Humanities (summa cum laude) Bradford College, Bradford, England

Honors and Awards

Teaching-Writing Fellow, University of Iowa, 1996–1997

Present Position

English Language Arts Test Development Specialist, American Institutes for Research (AIR)
Assists in the development of English language arts (ELA) assessment items and stimuli. Responsibilities include writing, editing, and reviewing items, providing feedback to item writers, and working closely with clients to ensure quality assessments.

Project Experience at AIR

As a Test Development Specialist, responsible for writing, editing, and reviewing ELA items for the Smarter Balanced Assessment Consortium (2013–Present). Developed items for the Ohio Achievement Assessments (2012–2013), Minnesota Comprehensive and Modified Assessments (2011–2012), Hawaii State Assessments (2011–2012), and Delaware Comprehensive Assessment System (2011–2012).

Additional Project Experience

Worked as the ELA Specialist, Curriculum and Assessment, at Measured Progress (2009–2011). Responsibilities included development of ELA materials in accordance with state and district frameworks and guidelines. Development work typically included locating grade-appropriate reading passages, producing items that measure each state's frameworks, and meeting with advisory committees and departments of education. In addition, responsible for writing annotations for state released items, providing detailed explanations of score-point exemplars. Also, worked as the Quality Assurance Coordinator at Measured Progress (2005–2008). Evaluated standardized tests in the content areas of reading and writing, monitored scorer performance as a Senior Reader, prepared and conducted scorer training, monitored progress of scoring project, and evaluated scorer and Senior Reader performance as a Quality Assurance Coordinator. Assembled anchor and training packs in accordance with project standards.

Employment History

2011–Present	English Language Arts Test Development Specialist, AIR, Washington, DC
2009–2011	ELA Specialist, Curriculum and Assessment, Measured Progress, Dover, NH
2005–2008	Quality Assurance Coordinator, Measured Progress, Dover, NH
2002–2005	Instructor of English, Merrimack College, North Andover, MA
1998–2005	Reading Instructor, Northern Essex Community College, Haverhill, MA
2002–2004	Writing Instructor, Northern Essex Community College, Haverhill, MA
2000–2004	Reading Center Staff Member, Northern Essex Community College, Haverhill, MA

Sean Redmond, M.A.

Lead, English Language Arts High School

Education

M.A.	2004, English Literature San Francisco State University, San Francisco, CA
B.A.	1999, English and Secondary Education (cum laude) University of Michigan, Ann Arbor, MI

Professional Credentials and Certifications

Michigan Secondary Teaching Certificate in English and Social Studies, 1999

Present Position

English Language Arts Test Development Specialist, American Institutes for Research (AIR)
Assists in the development of English language arts (ELA) assessment items and stimuli. Responsibilities include writing, editing, and reviewing online and paper-and-pencil test items; training and providing feedback to item writers; resolving client feedback issues; and meeting with clients for item and passage reviews

Project Experience at AIR

Writes, edits, and reviews online and paper-and-pencil test items; trains and provides feedback to item writers; resolves client feedback issues; and conducts meetings with clients for item and passage reviews as the Test Development Specialist for the Minnesota Comprehensive Assessments (2011–Present).

Additional Project Experience

The Lead Content Editor, Educational Product Development at Riverside Publishing (2009–2011). Researched state standards for multiple subjects to guide development of the next-generation Iowa Tests. Cognitive Abilities Test (CogAT) Content and Verbal Lead, guiding development and production activities, including building test forms for all verbal test items through national item tryout, standardization, and operational forms while overseeing all CogAT content and training team members. As the Editor of Assessment and Standards Development Services at WestEd (2005–2009), led ELA test development for several key states, writing and editing ELA test items and passages, benchmarking and ensuring alignment to state standards, building forms (Kentucky), and checking for fluency, readability, grammar, and content.

Employment History

2011–Present	English Language Arts Test Development Specialist, AIR, Chicago, IL
2009–2011	Lead Content Editor, Riverside Publishing, Rolling Meadows, IL
2005–2009	ELA Editor, WestEd, Chicago, IL
2004–2005	Editor, Ohana Foundation
2003	Teaching Assistant, San Francisco State University
2003	SAT Verbal Instructor, Monica's Learning Center
2002–2004	Tutor, San Francisco State University Educational Opportunity Program
2001–2002	Teacher, Lincoln Elementary School
2000–2001	Instructional Assistant, Sunnyvale Middle School

Charles Ferry, M.A.T.

Lead, English Language Arts High School

Education

M.A.T.	2007, Secondary English Education Piedmont College, Demorest, GA
B.A.	2004, English The University of Georgia, Athens, GA

Professional Credentials and Certifications

Grades 6–12 English Teacher Certification, Office of the State of Georgia, Superintendent of Education, 2009

Grades 6–12 English Teacher Certification, Georgia Department of Education, 2007

Present Position

English Language Arts Test Development Associate, American Institutes for Research (AIR)
Develops, edits, and revises English language arts (ELA) test items for various ELA projects; develops curriculum and lesson plans for online learning system. Completed the AIR form-building training module.

Project Experience at AIR

Develops, edits, and reviews content for various ELA projects as the Test Development Associate. Involved in editing a wide range of middle and high school level content for the Smarter Balanced Assessment Consortium (2012–Present). Fluent in Common Core State Standards (CCSS) and was integral in the development of the passage and item specifications that are used to develop the assessment aligned to Utah's Core Standards for the Student Assessment of Growth and Excellence (SAGE) for ELA (2013–Present) and the AIR Common Core Internal project (2013–Present). Has additional experience developing ELA test items for Delaware State Assessment (2012) and the Hawaii State Assessment (2012).

Employment History

2012–Present	English Language Arts Test Development Associate, AIR, Washington, DC
2011–2012	Literacy Teacher, E. L. Haynes Public Charter School, Washington, DC
2009–2011	English Teacher, Burroughs Education Campus, District of Columbia Public Schools, Washington, DC

Jim McCann, M.S.
Content Lead, Mathematics

Education

M.S. 2010, Educational Psychology (concentration in Assessment, Testing, and Evaluation)
George Mason University, Fairfax, VA

B.S. 2005, Elementary Education (concentration in Mathematics, minor in Sociology) (cum laude)
University of Maine, Orono, ME

Present Position

Mathematics Test Development Specialist, American Institutes for Research (AIR)
Supervises content staff during the item development, form construction, and pool management phases of a variety of projects. Item development includes writing and reviewing items both individually and in a group setting. Form construction involves selecting a set number of approved items and building a test that is statistically and contextually sound. Pool management includes the analysis of item pools to determine areas of strength and weakness to guide efficient future development. Works directly with clients and supervises content staff as they facilitate meetings with clients and classroom teachers.

Project Experience at AIR

Oversees the test development for all content areas for the Alternate Assessment for the state of Delaware as well as the mathematics items for Delaware's statewide assessment (2010–Present). Assisted in the oversight of test development for all content and areas for the alternate assessment for New Mexico, South Carolina Alternate Assessment and the modified assessments for the states of Ohio, Oregon, and Minnesota (2008–2010). Successfully managed the development of items as the Math Grade Level Lead for statewide assessments in Hawaii and Ohio (2006–2008).

Employment History

2010–Present Mathematics Test Development Specialist, AIR, Washington, DC
2008–2010 Test Development Associate, AIR, Washington, DC
2006–2008 Test Development Assistant, AIR, Washington, DC
2005–2006 Teacher, Stafford County, Virginia

Concordia University, Portland, OR

B.A. 2004, Secondary Education
Concordia University, Portland, OR

Present Position

Mathematics Test Development Specialist, American Institutes for Research (AIR)
Develops, reviews, and edits items for various statewide assessments. Works closely with national Common Core State Standards (CCSS) to write a variety of test items. Conducts content reviews on a variety of items for different projects.

Project Experience at AIR

Responsible for developing mathematics items for grades 3–12 as the Item Writer and Content Review for assessments, including the Utah State Assessment (2013–Present), Ohio Graduation Test (2013–Present), Minnesota State Assessment (2012–Present), and Smarter Balance Assessment Consortium (2012–Present). Responsible for directing creation and development for online diagnostic and achievement End-of-Course (EOC) exams for Algebra I as the Grade Level Lead for Hawaii State Assessment (2012–Present).

Additional Project Experience

Developed middle-school and upper-level assessments for various state and local projects; as a Test Development Specialist II, worked on Riverside Publishing's CCSS research-based interim shelf projects in Detroit, MI; Prince George's County, MD; and Oklahoma City, OK. In addition to building assessments, worked on item reads written from a variety of vendors and item writers, edited a variety of items for an item bank, and worked on various state alignments for both existing and new items (2010–2012).

Employment History

2012–Present Mathematics Test Development Specialist, AIR, Chicago, IL
2010–2012 Math Test Development Specialist, Riverside Publishing, Rolling Meadows, IL
2009–2010 ACT Prep/Consumer Education Teacher, Kenwood Academy High School, Chicago, IL
2008–2009 Secondary Mathematics Teacher, East Leyden High School, Schiller Park, IL
2004–2008 Secondary Mathematics and English teacher, William Howard Taft High School, Chicago, IL

Chris Kincheloe, B.S.

Lead, Mathematics High School

Education

B.S. 2007, Mathematics
University of Illinois at Urbana-Champaign, Champaign, IL

Present Position

Mathematics Test Developer, American Institutes for Research (AIR)
Writes, reviews, and revises test items based on content and fairness for a range of mathematics assessments.

Project Experience at AIR

As the Mathematics Test Developer, responsibilities include creating, reviewing, and revising test items based on standard alignment and content for the Ohio Graduation Test (2013–Present) and the Utah State Office of Education (2013–Present).

Additional Project Experience

Worked as the Content Developer on MathXL and MyMathLab for Pearson (2008–2013), creating algorithmic math items for developmental mathematics through third-year calculus, which were used in MathXL and MyMathLab in online homeworks, tutorials, and assessments. Established new and efficient ways to develop algorithmically challenging items and created templates that could be used in the future for similar items. As part of a select group of developers, tested new functionality on the assessment and tutorial sites before public release. As part of a select group of developers, mapped learning objectives in textbooks, which were used to create adaptive homeworks and assessments for students.

Employment History

2013–Present Mathematics Test Developer, AIR, Washington, DC
2008–2013 Content Developer, Pearson, Washington, DC

Roshanak Matewere, B.A.
Lead, Mathematics High School

Education

M.A. Candidate	Expected 2015, Public Policy George Mason University, Arlington, VA
B.A.	2000, Mathematics (minor in History, with a concentration in U.S. History) George Mason University, Fairfax, VA

Present Position

Mathematics Test Development Associate, American Institutes for Research (AIR)
Develops mathematics test items for a variety of statewide assessments. Writes, edits, and reviews math test items; resolves team and client feedback on test items; leads client-facing committee meetings; and participates in developing machine-scored constructive-response items. Codes technology-enhanced items for different projects at AIR.

Project Experience at AIR

Successfully manages the development of math items for grades 7, 8, and 10 as the Grade Level Lead for the Hawaii State Assessment (2011–Present). Participates in the item development process as the Test Developer for statewide assessments, including Hawaii State Assessment (2011–Present), Minnesota Assessment System, Delaware Comprehensive Assessment System, and Ohio K–8 Assessment (2011).

PROFESSIONAL EXPERIENCE

2011–Present	Mathematics Content Specialist, Performance Assessment Services, Data Recognition Corporation, Plymouth, MN
2009–2011	Scoring Director, Performance Assessment Services, Data Recognition Corporation, Plymouth, MN
2006–2011	Mathematics Item Writer, Test Development, Data Recognition Corporation, Maple Grove, MN
2009–2011	Image Field Definition Specialist, Education Information Systems and Imaging Information Systems, Data Recognition Corporation, Maple Grove, MN
2001–2009	Project Team Leader/Scorer, Performance Assessment Services, Data Recognition Corporation, Minnetonka, MN
2000–2011	Advisor—Technology Integration and Business Development, Sovereign Grounds, Inc., Minneapolis, MN
1993–2000	Research Assistant, Department of Electrical and Computer Engineering, University of Minnesota, Minneapolis, MN

PROJECT-SPECIFIC EXPERIENCE

2002–2005	Arkansas Comprehensive Testing & Assessment Program:, End-of-Course Examinations
2004–2011	Alaska Comprehensive System of Student Assessment: High School Graduation Qualifying Examination and Standards Based Assessment
2006–2011	Idaho Standards Achievement Test
2001–2010	Louisiana Educational Assessment Program
2010–2011	Pennsylvania Keystone Exams
2001–2009	Pennsylvania System of School Assessment
2008–Present	Washington Comprehensive Assessment Program: High School Proficiency Exams and Measurements of Student Progress
2010–Present	Washington Comprehensive Assessment Program: End of Course Assessments

EDUCATION AND CERTIFICATIONS

Ph.D., ABD	Electrical and Computer Engineering, University of Minnesota, Minneapolis, MN
M.S.E.E.	Electrical and Computer Engineering, University of Minnesota, Minneapolis, MN
B.S.E.E.	Electronics and Communications Engineering, Istanbul Technical University, Istanbul, Turkey

JAMES BELL

Senior English Language Arts Content Specialist

PROFESSIONAL EXPERIENCE

2013–Present	Senior English Language Arts Content Specialist, Data Recognition Corporation, Maple Grove, MN
2010–Present	Chair, Department of English, Foreign Language and Humanities, Northwestern Oklahoma State University, Alva, OK
1999–2010	Director of Institutional Assessment, College of the Ozarks, Point Lookout, MO
1992–Present	Freelance Writer, Editor, and Committee Facilitator

PROJECT-SPECIFIC EXPERIENCE

2012–Present	Pennsylvania Keystone Exams
2012–Present	Pennsylvania System of School Assessments

COMMON CORE STATE STANDARDS (CCSS) EXPERIENCE

- Developed CCSS-aligned items, passages, and scoring rubrics for LA in English Language Arts (Grades 3–8)
- Developing CCSS-aligned items for the Smarter Balanced Assessment Consortium
- Participated in discussions of PARCC-related issues as a faculty representative to the Course Equivalency Project Discipline Committee meetings sponsored by the OK State Regents for Higher Education, and as a university representative to meetings sponsored by the Oklahoma Association of Colleges for Teacher Education

EDUCATION AND CERTIFICATIONS

Ph. D.	English, Texas Tech University, Lubbock, TX
M.A.	English, Texas Woman's University, Denton, TX
B.S.	Secondary Education: English and Psychology Lamar University, Beaumont, TX

ANNE KIRPES

Reading Test Development Director

PROFESSIONAL EXPERIENCE

2002–Present	Reading Test Development Director, DRC, Maple Grove, MN
1998–2002	Sr. Test Development Specialist, The Riverside Publishing Company, Itasca, IL
1989–1998	Teacher

PROJECT-SPECIFIC EXPERIENCE (current)

2005–Present	Alabama High School Graduation Exam
2009–Present	Alabama Reading and Mathematics Test+
2004–Present	Alaska Comprehensive System of Student Assessment: High School Graduation Qualifying Examination and Standards Based Assessment
2012–Present	Florida Student Standards Tutorial Project Committee of Experts
2006–Present	Idaho Standards Achievement Tests
2012–Present	Michigan Interim Assessment
2011–Present	Michigan K–12 Item Development
2009–Present	Nebraska State Accountability
2009–Present	Pennsylvania Classroom Diagnostic Tools
2009–Present	Pennsylvania Keystone Exams
2002–Present	Pennsylvania System of School Assessment
2009–Present	Pennsylvania Voluntary Model Curriculum
2008–Present	Washington Comprehensive Assessment Program

COMMON CORE STATE STANDARDS (CCSS) EXPERIENCE

- Reviewed proposed AK alignment to the Common Core and provided feedback
- Reviewed AL reading alignment to the Common Core and provided feedback
- Develop PA assessment anchors and eligible content and learning progressions aligned to the Common Core and developed new reading passages, items, and scoring guidelines aligned to these new PA standards
- Developed CCSS-aligned items for the PA CDT and Keystone Exams
- Aligned existing LA assessments to the Common Core and oversaw the development of new reading passages, items, and scoring rubrics for the inclusion in the transitional ELA assessments
- Oversees item development for the Smarter Balanced Assessment Consortium

EDUCATION AND CERTIFICATIONS

Ed.M.	Education, concentration in Teaching and Learning, Harvard University Graduate School of Education, Cambridge, MA
B.A.	Elementary Education, Reading/Language Arts, University of Northern Iowa, Cedar Falls, IA
	State of Illinois—Language Arts, Grades K–9, Elementary, Grades K–6

JOHN SELISKY

Director, Test Development for Mathematics

PROFESSIONAL EXPERIENCE

2012–Present	Director, Test Development for Mathematics, DRC, Plymouth, MN
2009–2012	Senior Project Lead, DRC, Plymouth, MN
2008–2009	Student Assessment Specialist, Chicago Public Schools, Chicago, IL
2006–2008	Publishing Project Manager, CTB McGraw-Hill, Burr Ridge, IL
2003–2006	Mathematics Assessment Specialist, Educational Testing Service, Princeton, NJ
2002–2003	Head of Special Project Development, Educational Testing Service, Princeton, NJ
1999–2002	Senior Mathematics Consultant, Riverside Publishing, Itasca, IL
1996–1999	Mathematics and Science TD Specialist, Riverside Publishing, Itasca, IL
1971–1996	Teacher and Assistant Professor of Education and Mathematics

PROJECT-SPECIFIC EXPERIENCE

2012–Present	Alaska Comprehensive System of Student Assessment: High School Graduation Qualifying Examination and Standards Based Assessment
2010–Present	Louisiana Educational Assessment Program
2012–Present	Michigan K-12 Item Development
2012–Present	Michigan Interim Assessment
2011–Present	Nebraska State Accountability
1999–2002	Oklahoma School Testing Program
2009–Present	Pennsylvania Classroom Diagnostic Tools
2009–Present	Pennsylvania Voluntary Model Curriculum

COMMON CORE STATE STANDARDS (CCSS) EXPERIENCE

- Conducted CCSS alignment studies for PA Assessment Anchors and Eligible Content
- Developed sample items for PA Keystone Examination
- Developed and wrote 114 lesson assessments for the PA Voluntary Model Curriculum
- Conducted alignment studies for mathematics standards for the LA LEAP
- Reviewed and evaluated mathematics items for the MEAP, MI Access, and MME
- Conducted item writing training activities for MI educators
- Supervises mathematics item development for Smarter Balanced Assessment Consortium

EDUCATION AND CERTIFICATIONS

Ed.D.	Mathematics Education Teachers College, Columbia University, New York, NY
M.A.	Instructional Technology Teachers College, Columbia University, New York, NY
M.A.	Secondary Education, Lehigh University, Bethlehem, PA
B.S.	Earth and Planetary Sciences and Mathematics, University of Pittsburgh, Pittsburgh, PA
PMP®	Project Management Professional, Project Management Institute

CHRISTOPHER K. PETERSON

Senior Mathematics Test Development Specialist

PROFESSIONAL EXPERIENCE

2010–Present	Senior Mathematics Test Development Specialist, DRC, Maple Grove, MN
2005–2010	Mathematics Teacher, South View Middle School, Edina, MN
2003–2005	Special Education Paraprofessional, Valley View Middle School, Edina, MN
1999–2001	Research Analyst, DRC, Maple Grove, MN
1998–1999	Quality Assurance Analyst, DRC, Minnetonka, MN

PROJECT-SPECIFIC EXPERIENCE

2011–Present	Alabama Reading and Mathematics Test^{+}
2011–Present	Louisiana Educational Assessment Program
1999–2001	Louisiana Educational Assessment Program for the 21st Century
2011–Present	Michigan K-12 Item Development
2010–Present	Pennsylvania Classroom Diagnostic Tools
2010–Present	Pennsylvania Keystone Exams
2010–Present	Pennsylvania System of School Assessment
2012–2013	Smarter Balanced Assessment Consortium Pilot Test Item Development
2013–Present	Smarter Balanced Assessment Consortium Field Test Item Development
1998–2001	South Carolina Palmetto Achievement Challenge Tests

COMMON CORE STATE STANDARDS (CCSS) EXPERIENCE

- Led the development of elementary, middle, and high school items for the 2013 SBAC pilot test and the 2014 SBAC field test
- Led the development of elementary items for DRC-facilitated SBAC cognitive labs
- Worked on the alignment review of the existing LA assessments to the Common Core in LA's effort to transition to the CCSS for mathematics and the implementation of PARCC assessments
- Worked on the development of new mathematics items and scoring rubrics for the inclusion in the transitional LA Mathematics assessments
- Worked with committees of PA educators to develop PA assessment anchors and eligible content and learning progressions aligned to the Common Core
- Responsible for the development of new mathematics items and scoring guidelines aligned to the PA Core Standards

EDUCATION AND CERTIFICATIONS

M.Ed.	Teaching, University of St. Thomas, Graduate School of Education, Minneapolis, MN
B.S.	Mathematics, Wheaton College, Wheaton, IL
	State of Minnesota–Secondary Mathematics, Grades 5–12

CHRISTIE PLACKNER

Manager, Psychometric Quality

PROFESSIONAL EXPERIENCE

2010–Present	Manager, Psychometric Quality, Data Recognition Corporation, Maple Grove, MN
2008–2010	Psychometrician, Data Recognition Corporation, Maple Grove, MN
2005–2008	Senior Statistical Analyst, Data Recognition Corporation, Maple Grove, MN
2002–2005	Statistical Analyst, Data Recognition Corporation, Maple Grove, MN
1999–2002	Research Associate, Applied Measurement Professionals, Inc., Lenexa, KS
1998–1999	Test Development Specialist, Applied Measurement Professionals, Inc., Lenexa, KS
1998	Test Development Assistant, Applied Measurement Professionals, Inc., Lenexa, KS
1996–1997	Research Assistant, Mei Technology, San Antonio, TX
1997	Intern, United Services Automobile Association (USAA), San Antonio, TX

PROJECT-SPECIFIC EXPERIENCE

2009–Present	Idaho Standards Achievement Test
2002–Present	Louisiana Educational Assessment Program:
2011–Present	Pennsylvania System of School Assessment

EDUCATION AND CERTIFICATIONS

Ph.D.	Educational Psychology, Quantitative Methods in Education *(in progress),* University of Minnesota, Minneapolis, MN
M.A.	Industrial/Organizational Psychology, St. Mary's University, San Antonio, TX
B.S.	Psychology, Valparaiso University, Valparaiso, IN

YI DU

Managing Senior, Psychometrics

PROFESSIONAL EXPERIENCE

2004–Present	Managing Senior, Psychometrics, Data Recognition Corporation, Maple Grove, MN
2007–Present	Adjunct Assistant Professor, Saint Mary's University and the University of Minnesota, Minneapolis, MN
1999–2004	Director of Research and Evaluation, Edina Public Schools, Edina, MN
1996–2004	Technical Advisor, Minnesota Department of Education (MDE), Roseville, MN
1995–1999	Assistant Director & Testing Assessment Specialist II, Department of Research, Evaluation, and Assessment, Minneapolis Public Schools, Minneapolis, MN
1992–1995	Psychometrician, Department of Student Assessment, Illinois State Board of Education, Springfield, IN
1991	Pre-Doctor Fellow, Statistical and Psychometrical Research and Service, Education Testing Services, Princeton, NJ
1987–1988	Visiting Scholar, University of California, Berkeley, CA
1984–1987	Assistant Professor, Beijing University, China

PROJECT-SPECIFIC EXPERIENCE

2005–2006	Georgia High School Graduation Tests
1992–1995	Illinois Goal Assessment Programs
2007–Present	*Integrated* Louisiana Educational Assessment Program
2007–Present	Louisiana Educational Assessment Program
2012–Present	Michigan Interim Assessments
1996–2005	Minnesota Basic Skills Test
2000–2005	Minnesota Comprehensive Assessments
2006	North Carolina Test of U.S. History and Test of Civics and Economics: Standard Setting Services
2011	Pennsylvania System of Student Assessment: Standard Setting Services
2006–2007	South Carolina Palmetto Achievement Challenge Tests

EDUCATION AND CERTIFICATIONS

Ph.D.	Measurement, Evaluation, and Statistical Analysis, University of Chicago, Chicago, IL
M.S.	Management Information Systems—Beijing University, Beijing, China
B.S.	Management Information Systems—Beijing University, Beijing, China
PMP®	Certified Project Management Professional— Project Management Institute

Contract #14-652, Attachment I

American Institutes for Research

Price Response

Price Reply

The American Institutes for Research (AIR) has based our proposal and fixed prices on the terms, conditions, and schedule of the Florida Standards Assessments, ITN 2014-47, as amended by:

- Addendum #1 issued on or about October 31, 2013
- Addendum #2 issued on or about November 12, 2013
- Addendum #3 issued on or about November 18, 2013
- Excel spreadsheet version of 7.8 Deliverables received from Fran Shewan

Assumptions Underlying Our Fixed Prices

We have documented our assumptions throughout this proposal and have relied on the Q&As in every case where they clarify or further define the requirements of the ITN. We have also based our proposal on the following assumptions:

- AIR is proposing to leave Florida with a **completely Florida-developed and Florida-owned assessment** at the end of the contract.
  - AIR is proposing licensing of Utah Student Assessment of Growth and Excellence (SAGE) and/or the Smarter Balanced Assessment Consortium item banks to enable Florida to build and administer an assessment beginning in the 2014–15 school year. This is discussed in more detail under "Licenses" below.
  - AIR is proposing significant new item development to allow Florida to build an assessment that does not contain any SAGE or Smarter Balanced licensed materials. Florida will have approved, and will own, all of these items.
  - AIR will provide copyright permissions for any third-party passages for the length of the contract.
  - AIR and Florida will agree on terms whereby AIR will retain ownership of all software and other AIR intellectual property (IP), as well as any derivations of this IP, developed before entering into the contract.

  AIR understands the Department reserves the right to request alternative intellectual property arrangements during negotiations in order to obtain a reply that provides the best value to the state.
- The format and general content for the online score reporting, data file formats, and other reports and documents will be finalized with the first operational use.
- In the event of a reduction or change in the scope of work or partial termination for convenience, AIR assumes that any adjustment in contract price will account for potential

increases in the price of the remaining tasks occasioned by such a reduction or change in the scope of work.

- Any conflicts between the provided documents (e.g., the ITN, Terms and Conditions, and Proposal) will be resolved during negotiations. We assume that the final contract will include an order of precedence in which AIR's proposal is read together with the ITN and Q&As to determine the contract requirements.

- Section 5.19, Liquidated Damages, refers to interim deliverables, final deliverables, critical work tasks, and extremely critical work tasks. We did not identify a clear designation of interim and final deliverables in Section 7.8 of the ITN, nor a clear relationship between the critical work tasks in Appendix B of the ITN and the deliverables on Section 7.8 of the ITN. We assume we will clarify a final list of tasks subject to liquidated damages as part of the contract, with the specific amounts associated, during negotiations. AIR agrees to the 10% cap on liquidated damages proposed by the Department in Section 5.19.c, and we assume the "total contract amount" in this section means the total contract amount for that year.

- Per Section 5.15 of the ITN, Performance Bond, AIR will deliver the required performance bond within 10 calendar days prior to beginning work under the contract. We assume this section means a one-year bond (or adjusted period) for 10% of the total annual contract amount and that the Department will return the prior-year bond as AIR delivers each new annual bond.

We do not believe any of these assumptions represent exceptions to the Terms and Conditions of the ITN.

Specific Deliverable Assumptions

- Per Section 7.2.1, we have based our quantities of materials on the expected number of students, shipping destinations, and schools provided in Appendix C, with the required 10% overage. We based our handscoring estimates on these actual quantities before materials overage.

- In Section 7.3.7.3, AIR has not proposed to exclude performance tasks but rather to base retakes on machine-scored items to support immediate scoring and reporting. As an option, we could extend this capability to the essays in the retake writing assessment. As a further option, we could offer either 100% handscoring as a second read for all machine-scored items on the retakes or a less expensive verification of machine scores on a sample (e.g., 10–20%) of student responses.

- In Sections 7.3.11.2.5 and 7.3.11.2.5.6, we have included functionality to support English-to-Heritage Language Translation Dictionary through glossaries that can be associated with individual words or phrases in a question or passage and to deliver sign language by displaying videos of people signing. Each of these functions depends on item-level tagging that is not included (or required) in the base scope of this ITN.

- We assume the requirement to support simultaneous online users under Section 7.4.9.2 of the ITN refers to the 50% of the current membership eligible to test rather than the overall membership.

- In Section 7.6.2.1, we have included $40,000 per year in our budget to engage an independent subcontractor for SES replication and will work with Florida to select the appropriate individual or organization and review and approve the subcontract scope of work.

Licenses

Our budget includes the license to use the Utah SAGE items for all years of census paper testing and for the first three years of online testing in each grade/subject and the End-of-Course (EOC) assessment. After that point for each assessment, AIR will have developed sufficient items so that Florida will have transitioned to a completely Florida-developed and Florida-owned assessment.

The Utah State Office of Education (USOE) has agreed to license these items to Florida under one of two models:

- Florida may select one or more fixed forms from the bank for a license fee of $2 per student per form. Hence, if Florida chooses to select one form per grade/subject, the license fee will be $4 per student. This is the license in our proposed budget. As an option to this model, but not required in the ITN, Florida could choose to select a primary form and a breach form for a license fee of $8 per student.

- Florida may elect to participate in Utah's adaptive version of the test, using Utah's blueprint, at a license fee of $2 per test administered.

Our budget assumes the first model, without the breach form.

USOE recognizes that Florida may need to, or may unintentionally, release items. In this case, USOE has agreed to allow release of the items selected by Florida for a price of $5,000 per released item to reimburse USOE for the cost of replacing these items in the pool.

Our budget also includes the costs for a license for the summative Smarter Balanced assessments to embed sufficient items during Year 1 to link the Florida Standards Assessments (FSA) to the Smarter Balanced scale and for the integration of the Programme for International Assessment (PISA) items to link FSA to the PISA scale. As an option, Florida could chose to use the Smarter Balanced assessments instead of the SAGE assessments as the base assessment for the FSA. If Florida is interested in this option, we would be happy to discuss costs during negotiations.

Completing Exhibit 7.8

Pricing by Component

AIR has submitted prices for each of the four components (A, B, C, and D) and for the overall contract (Component E).

In pricing by individual Components A–D, the sum of the component prices are much higher than our combined price (Component E). The Department will recognize there are significant initial setup costs for administering the first online or the first paper-and-pencil test as well as for some overall project management and other costs (e.g., Technical Advisory Committee support) that do not vary with the number of subjects or tests. Some tasks (e.g., studies) are virtually duplicated across components. Similarly, there are savings from managing multiple programs together. Therefore,

adding any combination of Components A–D would result in an incorrect high price.

If the Department is interested in some other combination other than any one or all four components (e.g., grades 3–8 English Language Arts/Literacy (ELA/L) plus grades 3–8 Mathematics), we would be happy to provide such pricing.

Matching ITN Requirements to Specific Deliverables

Spreading our costs across all of the specific deliverables in Exhibit 7.8 is not an exact science. Many deliverables are interrelated and/or are completed in combination with other deliverables. In addition, we have found that clients prefer to make larger payments when specific milestone tasks are accomplished, such as the delivery of items, test materials, score reports, and technical reports.

We have placed a price in virtually every cell of the pricing sheet, and we tried to match all of the ITN requirements to specific deliverables on Exhibit 7.8. We made assumptions where the match was not entirely clear to us. Some examples of these assumptions include:

- We were not clear where to place costs for new item development in Section 7.3.3 of the ITN. We placed these costs in the deliverable titled "Periodic: Field Test Item Sets and Forms Review" in Year 1 and the deliverable titled "Periodic: Content Item Review 'Cleans'" in Years 2–6. We also placed the licensing fee for the Utah SAGE and Smarter Balanced item banks in these lines. Also, AIR proposes to develop items in Year 1, so we included the Item Development Plan and Item Writer Training costs in the "Field Test Item Sets and Forms Review" deliverable for Year 1.

- Exhibit 7.8 did not include a line for training development and delivery before August 2015. We included the costs to develop and deliver training in advance of spring and summer 2015 testing under the deliverable titled "Training Plan" for Year 1.

- Test construction is broken across three deliverables on the Exhibit 7.8 Pricing Schedule:

  - Test Development: Periodic: Field Test Item Sets and Forms Review
  - Test Development: Periodic: Onsite Test Construction (Meeting)
  - Scaling, Equating, Scoring, and Special Psychometric Studies: Periodic: Development of Test Forms for Field Test and/or Operational Administrations

- AIR has proposed a significant number of machine-scored constructed-response items and has included associated rubric validation activities under the deliverable titled "Handscoring of Performance Tasks."

- We have assumed that student reports (two printed copies) will contain the performance task reports within the four pages AIR has budgeted per report and we have included those costs together in the deliverable titled "Initial Reporting Student Reports and CD/DVDs or Jump Drives."

- We understand we must convene the Florida Technical Advisory Committee (TAC) in Section 7.6 and have placed these associated costs under the deliverable titled "Scaling, Equating, Scoring, and Special Psychometric Studies: Creating and Finalizing Technical

Reports." We have assumed the payments to and travel for TAC members will be covered under reimbursable expenses.

- As indicated in ITN Section 7.3.6, there is no place for a price for a stand-alone ELA/L field test on the Exhibit 7.8 Pricing Schedule, and thus we did not include this cost. Per the ITN, if it is determined during negotiations that a stand-alone field test will take place, all test administration and scoring schedules and deliverables will be agreed upon prior to contract execution.

- We have proposed standard setting for Year 1 (2014), but Exhibit 7.8 includes places for this cost in Year 2. Similarly, the linking study may also occur sooner than shown in the deliverable schedule. We would expect we would determine the final placement of these costs during negotiations.

Within our total proposed annual prices, we will be happy to move costs between line items if any of our assumptions are incorrect and/or to negotiate with the Department on others changes to specific payments.

Printing Exhibit 7.8

As directed by the ITN instructions, we have placed our fixed prices in Exhibit 7.8, "ITN 2014-47 Attachment 1b Deliverables Pricing." However, we note both the PDF and Excel versions of this form provided by the Department print on legal-sized paper, which conflicts with the ITN Section 6.2.4 requirement to deliver the proposal on letter-sized paper. Considering this conflict, we printed Exhibit 7.8 directly from the Excel file provided by the Department (i.e., on legal-sized paper). If this was incorrect, we would be happy to redeliver Exhibit 7.8 in letter size (obviously with no changes to the prices). Please note we provided the PDF versions in both letter and legal size, along with the completed Excel version.

As directed by the ITN, we have placed our fixed prices in the deliverables column of Exhibit 7.8. Rather than printing additional copies of each component, we added columns for Components A–E. We hope the reviewers find this easier to review our line item and total prices across components.

Attachment 1
ITN 2014-47 Florida Standards Assessment

RESPONDENT : American Institutes for Research

We propose to provide the services being solicited for ITN 2014-47 Florida Standards Assessments. All work shall be performed in accordance with the specifications of this ITN, which has been reviewed and understood. **The below prices are all inclusive. Payment for services will be made based on the deliverables and dates specified. There shall be no additional costs charged for work performed under this ITN, unless changes are made during the negotiation phase.**

Respondents may submit bids on any individual assessment components (A, B, C or D), any group of assessment components, or to provide all assessment components (A, B, C and D). The prices on this sheet will be used for evaluation purposes. All accommodations and deliverable costs should be included in each component price. In addition, Respondents should complete the pricing per deliverable in SECTION 7.8, for each assessment component, which will be used for negotiation purposes and any resulting contract.

1	**Deliverable Category**	**Contractor Deliverable**	**Deliverable Description**	**Evidence of Completion**	**Due Date(s)**	**Component A 3-8 ELA**
63			[illegible] scorers for the constructed-response items. Each sample item from the scoring papers is displayed as it appeared on the test and responses for each score point, images of student responses, and annotations explaining why the response received a particular score are provided. ITN Reference 7.3.10		(Renewal 3 - 2020)	$2,000.00
64	Test Development	Periodic: Understanding Florida's Assessment Reports	This publication describes the various reports of test results distributed to students, schools, and districts. An explanation and an image of each type of report are provided. The booklet also includes information about the test content areas and a glossary of technical terms. The contractor will deliver the electronic ADA-compliant PDF for posting to the DOE website so files can be posted to coincide with the first results delivery (RD1). ITN Reference 7.3.7.5	(1) Provide Department email reflecting approval of Understanding Florida's Assessment Reports. (2) Final PDF files provided via SFTP.	(Dates TBD - These should coincide with the approved report release dates, which are part of contract negotiations.) 2015	$67,402.00
65					2016	$2,000.00
66					2017	$2,000.00
67					(Renewal 1 - 2018)	$2,000.00
68					(Renewal 2 - 2019)	$2,000.00
69					(Renewal 3 - 2020)	$2,000.00
70	Test Development	Periodic: Test Design and Blueprint	The Test Design and Blueprint will clearly delineate the number of items, types and placement of items, time allotted for each test session, and location of field-test items for all grades and subjects. ITN Reference 7.3.1 and 7.3.2.1	(1) Provide Department email reflecting approval of Test Design and Blueprint (2) Appearance of completed schedule in weekly management report	June 1, 2015	$147,745.00
71	Test Development	Periodic: Content Item Review "Cleans"	After Content Item Review, the contractor, in conjunction with the Department, will conduct an editorial and content review of the items to ensure that changes have been applied correctly and that all editorial and content issues are corrected. ITN Reference 7.3.4.2	(1) Provide Department email reflecting completion of the “Cleans” process (2) Appearance of completed schedule in weekly management report	February 1, 2016	$3,956,087.00
72					February 1, 2017	$4,036,987.00
73					(Renewal 1 - February 1, 2018)	$2,137,072.00
74					(Renewal 2 - February 1, 2019)	$1,867,100.00
75					(Renewal 3 - February 1, 2020)	$1,584,816.00
76	Test Development	Periodic: Field Test Item Sets and Forms	Whether an embedded or stand-alone model is	(1) Provide Department email reflecting completion	May 1, 2015	$4,034,877.00

715			Mathematics and by subject for EOC. The Edited scanned data are loaded to online management system with the extracts for any CBT data. Additional processing is performed to resolve PreID data with gridded data, invoke any defaults necessary, and make some transformations for final scoring and creation of the State Student Results file during the editing process. ITN References 7.5.3, 7.5.6.2, and 7.5.6.4		(Renewal 3 - March 2020)	$0.00
716	Scoring and Reporting	Summer EOC: Early district and full-state scan/edit and CBT extract data files: Development of the file layouts, scan/edit and CBT extract data files	The contractor will work with the Department to develop the layouts for scan/edit and CBT extract data files. For each administration, the contractor unpacks and scans the documents to be scored and provides the scan files by grades for ELA/L and Mathematics and by subject for EOC. The Edited scanned data are loaded to online management system with the extracts for any CBT data. Additional processing is performed to resolve PreID data with gridded data, invoke any defaults necessary, and make some transformations for final scoring and creation of the State Student Results file during the editing process. ITN References 7.5.3, 7.5.6.2, and 7.5.6.4	(1) Final approved file layouts, early/full state scan/edit, and CBT extract data files, posted to online management system and SFTP. (2) Provide Department email reflecting receipt and approval of the file layouts and data files.	July 2015	$0.00
717					July 2016	$0.00
718					July 2017	$0.00
719					(Renewal 1 - July 2018)	$0.00
720					(Renewal 2 - July 2019)	$0.00
721					(Renewal 3 - July 2020)	$0.00
722	Scoring and Reporting	Fall ELA/L Retake: Anomalous score data files: Development of the anomalous score data files	The contractor will analyze the full state SSR and return a “Suppression” file with student invalidation to the Department. ITN Reference 7.5.6.3	(1) Anomalous score data files posted to SFTP. (2) Provide Department email reflecting receipt of the data files.	October 2015	$0.00
723					October 2016	$0.00
724					(Renewal 1 - October 2017)	$0.00

	A	B	C	D	E	F
1	**Deliverable Category**	**Contractor Deliverable**	**Deliverable Description**	**Evidence of Completion**	**Due Date(s)**	**Component A 3-8 ELA**
862	Scoring and Reporting	Spring EOC: Late reporting SSRs and DSRs data files: Development of SSR/DSR and multiple versions of DAR data files.	The contractor will work with Department Scoring and Reporting Staff to develop the State Aggregated Results (SAR) and District Aggregated Results (DAR) file layouts and use the layout to develop the SAR/DAR data files. The SSR files contain all of the scores and codes described in the SSR layout for all students tested in the State. A DSR file contains data for the students in that district. ITN Reference 7.5.5.2 and 7.5.6.6	(1) Final late reporting SSR and DSR data files posted to online management system and SFTP. (2) Provide Department email reflecting receipt and approval of the data files.	June 2015	$0.00
863					June 2016	$0.00
864					June 2017	$0.00
865					(Renewal 1 - June 2018)	$0.00
866					(Renewal 2 - June 2019)	$0.00
867					(Renewal 3 - June 2020)	$0.00
868	Scoring and Reporting	Summer EOC: Late reporting SSRs and DSRs data files: Development of SSR/DSR and multiple versions of DAR data files.	The contractor will work with Department Scoring and Reporting Staff to develop the State Aggregated Results (SAR) and District Aggregated Results (DAR) file layouts and use the layout to develop the SAR/DAR data files. The SSR files contain all of the scores and codes described in the SSR layout for all students tested in the State. A DSR file contains data for the students in that district. ITN Reference 7.5.5.2 and 7.5.6.6	(1) Final late reporting SSR and DSR data files posted to online management system and SFTP. (2) Provide Department email reflecting receipt and approval of the data files.	October 2015	$0.00

1306			description of the outcomes produced from the operational and/or field test SES activities, including data files and reports. The plan must be vetted by TAC members. ITN Reference 7.6.2.1		(Renewal 3 - December 2019)	$2,000.00
1307	Scaling, Equating, Scoring, and Special Psychometric Studies	Periodic: Performing SES Activities	Conducting all scaling and equating, and scoring activities as laid out in the specifications. ITN Reference 7.6.0, 7.6.1, and 7.6.2	(1) Submit Final Scaled Item Parameter Estimates and Scored Files (secure files) to the Department, posted to SFTP. (2) Provide Department email reflecting receipt and approval of the files.	May 2015	$200,000.00
1308					May 2016	$200,000.00
1309					May 2017	$200,000.00
1310					(Renewal 1 - May 2018)	$200,000.00
1311					(Renewal 2 - May 2019)	$200,000.00
1312					(Renewal 3 -May 2020)	$200,000.00
1313	Scaling, Equating, Scoring, and Special Psychometric Studies	Spring ELA/L and Mathematics: Develop Calibration Sampling Specifications	The contractor's sampling specifications must include analyzing the most recent SSR files and establishing a road map for gathering the required data proven to represent the demographic characteristics of the state and student performance. The specifications will also address the steps, procedures, and software required for replication of the sampling procedures by the Department. The specifications will be reviewed by the Department and TAC members, if necessary, and updated by the contractor for each subsequent administration. ITN Reference 7.6.2.2	(1) Submit final Calibration Sampling Specifications via SFTP. (2) Provide Department email reflecting receipt and approval of the specifications.	(Dates to be negotiated) 2015	$3,000.00
1314					2016	$1,000.00
1315					2017	$1,000.00
1316					(Renewal 1 - 2018)	$1,000.00
1317					(Renewal 2 - 2019)	$1,000.00
1318					(Renewal 3 - 2020)	$1,000.00
1319	Scaling, Equating, Scoring, and Special Psychometric Studies	Spring EOC: Develop Calibration Sampling Specifications	The contractor's sampling specifications must include analyzing the most recent SSR files and establishing a road map for gathering the required data proven to represent the demographic characteristics of the state and student performance. The specifications will also address	(1) Submit final Calibration Sampling Specifications via SFTP. (2) Provide Department email reflecting receipt and approval of the specifications.	(Dates to be negotiated) 2015	$0.00
1320					2016	$0.00
1321					2017	$0.00
1322					(Renewal 1 - 2018)	$0.00
1323					(Renewal 2 - 2019)	$0.00

1324			the steps, procedures, and software required for replication of the sampling procedures by the Department. The specifications will be reviewed by the Department and TAC members, if necessary, and updated by the contractor for each subsequent administration. ITN Reference 7.6.2.2		(Renewal 3 - 2020)	$0.00
1325	Scaling, Equating, Scoring, and Special Psychometric Studies	Periodic: Creating and Finalizing Technical Reports	Preparing Technical Reports, as described in section 7.6.3.2. Note that Table of contents listed in 7.6.3.2 includes the minimum requirements for the report. Collecting Feedback from the Department and Technical Advisory Committee (TAC), finalizing the reports after incorporating the feedback, and submitting the final versions of the reports to the Department. ITN Reference 7.6.3.2	(1) Submit initial versions and the final versions of Technical Reports (secure) to the Department, posted to SFTP. (2) Provide Department email reflecting receipt and approval of the technical reports.	December 2015	$125,905.00
1326					December 2016	$202,094.00
1327					December 2017	$202,094.00
1328					(Renewal 1 - December 2018)	$202,094.00
1329					(Renewal 2 - December 2019)	$202,094.00
1330					(Renewal 3 - December 2020)	$202,094.00
1331	Scaling, Equating, Scoring, and Special Psychometric Studies	Periodic: Development of Scale Linking Plan: Scale Linking Plan for transitioning from FCAT 2.0 Reading & Mathematics and EOC Algebra 1 & Geometry to the Florida Standards Assessments	Scale Linking Plan for transitioning from FCAT 2.0 Reading & Mathematics and EOC Algebra 1 & Geometry to the Florida Standards Assessments ITN Reference 7.6.3.3	(1) Submit initial versions and the final versions of Scale Linking Plans (secure) to the Department, posted to SFTP. (2) Provide Department email reflecting receipt and approval of the linking plans.	November 2014	$20,412.00
1332						$0.00
1333	Scaling, Equating, Scoring, and Special Psychometric Studies	Periodic: Development of Scale Linking Plan: Collecting Legal Opinion	Collecting legal opinion, subject to the Department's approval, about the defensibility of linking methodology. ITN Reference 7.6.3.3	(1) Submit final version of the legal opinion document (secure) to the Department, posted to SFTP. (2) Provide Department email reflecting receipt and approval of the linking plans.	October 2014	$697,578.00
1334						$0.00
1335	Scaling, Equating, Scoring, and Special Psychometric Studies	Periodic: Linking Scales during transitioning years to find out FCAT 2.0 and EOC equivalents based on the performance of students on the Florida Standards Assessments	Conducting all linking operations and scoring activities as laid out in the approved linking specifications. ITN Reference 7.6.3.3	(1) Submit final look-up tables and scored files (secure files) to the Department, posted to SFTP. (2) Provide Department email reflecting receipt and approval of the files.	May 2015	$85,970.00
1336						$0.00

Specify Component A, B, C, D or E (A-D): _____A_____

	A	B	C	D	E	F
1	**Deliverable Category**	**Contractor Deliverable**	**Deliverable Description**	**Evidence of Completion**	**Due Date(s)**	**Component A 3-8 ELA**
1337	Scaling, Equating, Scoring, and Special Psychometric Studies	Periodic: Development of Standard Setting Work Plan	Prepare a Standard Setting Work plan for setting achievement level standards for ELA/Literacy, Mathematics, Algebra 1 &2, and Geometry assessments. Plan must include every detail of the methodology, internal and external data files, and the timeline for all of the activities during educator and reactor panel meetings. The Plan must be vetted by TAC members and the methodology must be approved by the department. ITN Reference 7.6.3.4	(1) Submit the final version of Standard Setting Work Plan and relevant materials, such as slides (secure materials), posted to SFTP. (2) Provide Department email reflecting receipt and approval of the documents.	January 2015	$2,000.00
1338	Scaling, Equating, Scoring, and Special Psychometric Studies	Periodic: Implement Achievement Level Standard Setting Meetings	Hold the required meetings and collect recommended cut scores from all relevant groups, as described in ITN Reference 7.6.3.4	(1) Submit the initial version of the Standard Setting Technical Report (secure file), including recommended cuts and impact data, to the Department via SFTP. (2) Provide Department email reflecting receipt and approval of the technical report and excel tables with interactive impact data and graphs.	October 2015	$161,561.00
1339	Scaling, Equating, Scoring, and Special Psychometric Studies	Periodic: Finalizing Standard Setting Technical Report	Preparing Technical Reports, as described in section 7.6.3.4. Collecting Feedback from the Department and Technical Advisory Committee (TAC), finalizing the reports after incorporating the feedback, and submitting the final versions of the reports to the Department. ITN Reference 7.6.3.4	(1) Submit the final version of the Standard Setting Technical Report (secure file) to the Department via SFTP. (2) Provide Department email reflecting receipt and approval of the technical report and excel tables with interactive impact data and graphs.	November 2015	$30,761.00
1340	Scaling, Equating, Scoring, and Special Psychometric Studies	Periodic: Development of Vertical Scaling Specifications	Preparing a detailed plan for conducting all vertical scaling procedures. The plan should include a comprehensive and detailed timeline for all tasks and events, as described in section 7.6.3.5 The plan must be vetted by TAC members. ITN Reference 7.6.3.5 (Repeated in contract renewal)	(1) Post the plan for Vertical Scaling (secure file) via SFTP. (2) Provide Department email reflecting receipt and approval of the Vertical Specifications.	November 2014	$9,000.00
1341					(Renewal 1 - November 2017)	$5,000.00

1	**Deliverable Category**	**Contractor Deliverable**	**Deliverable Description**	**Evidence of Completion**	**Due Date(s)**	**Component A 3-8 ELA**
1349			and events, as described in section 7.6.3.7 The plan must be vetted by TAC members. The plan should include the degree of comparability of item-level and test-level statistics across devices. The plan should include the degree of comparability of item-level and test-level statistics across various input types. For the questions above, the plan should address to what degree of comparability can be obtained through scaling items onto a single metric, linking or concordance. The plan should also include what interactions exist among device, input type and item/task characteristics, grade, subject, and relevant student characteristics. ITN Reference 7.6.3.6.1	approval of the study specifications.		$0.00
1350	Scaling, Equating, Scoring, and Special Psychometric Studies	Periodic: Performing Study for Comparability Between Devices Delivering Assessments, Preparing its Final Report, and Recommendations with TAC Committee	Conducting all of the planned analyses, preparing its technical report, and sharing the findings and recommendations with TAC members. ITN Reference 7.6.3.6.1	(1) Submit Final Report and Recommendations to the Department. These materials are secure, and therefore contractor shall post them to SFTP. (2) Provide Department email reflecting receipt and approval of the documents and files.	August 2015	$29,752.00
1351						$0.00
1352	Scaling, Equating, Scoring, and Special Psychometric Studies	Periodic: Development of a study plan for linking Florida Standards Assessments to other assessments measuring the same standards	Preparing a detailed plan for conducting the linking study. The plan should include a comprehensive and detailed timeline for all tasks and events, as described in section 7.6.3.8 The plan must be vetted by TAC members.	(1) The plan for conducting comparability study is secure, and therefore contractor shall post them to SFTP. (2) Provide Department email reflecting receipt and approval of the study specifications.	November 2015	$900.00

1358	Scaling, Equating, Scoring, and Special Psychometric Studies	Periodic: Linking Florida Standards Assessments to International Assessments	Conducting all of the planned analyses, preparing a final technical report, and sharing the results of linked relationships with TAC committee to discuss the validity of interpretations. ITN Reference 7.6.3.6.3	(1) Submit Final Report and Recommendations to the Department. These materials are secure, and therefore contractor shall post them to SFTP. (2) Provide Department email reflecting receipt and approval of the documents and files.	August 2016	$900.00
1359						$0.00
1360	Program Management	Periodic: Production Schedule	The production schedule shows the Department's beginning and ending review dates by test document for each review round. ITN Reference 7.7.2	(1) Appearance of schedule in weekly management report (2) Provide Department email reflecting approval of proposed or revised production schedule.	April 15, 2014	$66,198.00
1361					April 15, 2015	$27,930.00
1362					April 15, 2016	$27,930.00
1363					(Renewal 1 - April 15, 2017)	$27,930.00
1364					(Renewal 2 - April 15, 2018)	$27,930.00
1365					(Renewal 3 - April 15, 2019)	$27,930.00
1366	Program Management	Periodic: Program Management Meetings	The contractor will coordinate regular management meetings between the contractor and Department staff. The number and type of meetings are provided in 7.7.5 of the ITN.	(1) Include support for all meetings since the previous invoice. (2) Provide the meeting costs, a final agenda, and a final list of attendees for each meeting.	2015	$121,879.00
1367					2016	$122,426.00
1368					2017	$122,851.00
1369					(Renewal 1 - 2018)	$123,260.00
1370					(Renewal 2 - 2019)	$124,154.00
1371					(Renewal 3 - 2020)	$124,566.00
1372	Program Management	Periodic: Program Management Staff	The work described in the ITN constitutes a large, complex, challenging program that requires year-round activity and close attention to overlapping tasks for different years and the impact on project resources. The contractor is expected to provide a sufficient number of highly-qualified personnel to work closely with the Department to manage the contract. Specific requirements are in 7.7.2 of the ITN.	(1) Include support for program management staff operational for the invoice period. (2) Provide an organization chart with the appropriate staff indicated for each invoice period. (Quarterly invoices to occur in February, May, August, and November)	2015	$1,139,500.00
1373					2016	$1,276,463.00
1374					2017	$1,287,729.00
1375					(Renewal 1 - 2018)	$1,102,105.00
1376					(Renewal 2 - 2019)	$1,122,579.00
1377					(Renewal 3 - 2020)	$1,129,158.00
1378	Program Management	Periodic: Program Management Reports: Weekly Management and Action Item Report	The Weekly Management Report and Action Item Report will report the status of recent and upcoming tasks, highlighting those leading up to deliverables and critical tasks, report progress on program issues, identify unresolved issues, and maintain a list of requests requiring change orders	(1) For each invoice period, provide one management report from each month since the previous invoice period. (Quarterly invoices to occur in February, May, August, and November)	2014	$112,459.00
1379					2015	$112,459.00
1380					2016	$112,459.00
1381					(Renewal 1 - 2017)	$112,459.00
1382					(Renewal 2 - 2018)	$112,459.00

			maintain a list of requests requiring change orders or amendments. The weekly report will be provided to the Department by no later than noon one day prior to the weekly program management conference calls and will reflect the previous week's work. ITN Ref 7.7.6		(Renewal 3 - 2019)	$112,459.00
1383						
1384	Program Management	Periodic: Annual Program Review	Review will include a record of the contractor's services and deliverables in response to contractual/ITN requirements. This review must identify major program accomplishments and successes, as well as areas of the program that require changes and improvement in the upcoming year. The review is intended to be a history of program events and to describe recommended improvements or changes for subsequent years. The annual review will be based on information gathered by the contractor's program and project management staff throughout the year. The review will address all aspects of program service and products including management, technology, interpretive products, communications, development, test production, test administration, materials shipping/pickup, scoring, and reporting processes. It will also follow the annual administrative cycle, beginning with fall and ending with the following summer. ITN Reference 7.7.6	(1) Provide evidence of Department acceptance and approval of the annual program review for the previous administration year.	November 2015	$54,642.00
1385					November 2016	$54,642.00
1386					November 2017	$54,642.00
1387					(Renewal 1 - November 2018)	$54,642.00
1388					(Renewal 2 - November 2019)	$54,642.00
1389					(Renewal 3 - November 2020)	$54,642.00
1390	Program Management	Periodic: Program Management Reports: Collect Accounting Reports	A summary of the Quarterly Accounting Reports, including expenditures by program task and level of effort as well as expenditures and balances of Reimbursable Funding Categories identified in Section 7.7.9, including balances resulting from executed change orders and contract amendments	(1) For each invoice period, provide the quarterly accounting reports. (Quarterly invoices to occur in February, May, August, and November)	2014	$69,917.00
1391					2015	$69,797.00
1392					2016	$69,797.00
1393					(Renewal 1 - 2017)	$69,797.00
1394					(Renewal 2 - 2018)	$69,797.00

86					(Renewal 3 - July 15, 2019)	$48,762.00
87	Test Development	Periodic: Item Development Plan	To ensure the quality and number of items/passages developed is sufficient to create future operational test forms, the contractor will submit an item development plan delineating the number and types of items to be developed. ITN Reference 7.3.0	1) Provide Department email reflecting completion of the Item Development Plan. (2) Appearance of completed schedule in weekly management report.	December 1, 2015	$23,304.00
88					December 1, 2016	$23,304.00
89					(Renewal 1 - December 1, 2017)	$23,304.00
90					(Renewal 2 - December 1, 2018)	$23,304.00
91	Test Development	Periodic: Item Writer Training	The contractor must identify and recruit a sufficient number of highly-qualified writers for passages and items to ensure variety and quality of development. The contractor, in conjunction with the Department, will conduct an annual training session for all Item Writers. ITN Reference 7.3.3	1) Provide Department email reflecting completion of Item Writer Training. (2) Appearance of completed schedule in weekly management report.	December 1, 2015	$19,359.00
92					December 1, 2016	$9,109.00
93					(Renewal 1 - December 1, 2017)	$9,109.00
94					(Renewal 2 - December 1, 2018)	$9,109.00
95	Test Development	Periodic: Meetings with Educators	The contractor is responsible for organizing and convening meetings for the purpose of reviewing assessment items and otherwise supporting the assessment program. These meetings are referenced in the ITN in 7.3.4 and 7.7.7. This deliverable includes the cost of preparing for and	(1) Include support for all meetings since the previous invoice. (2) Provide the meeting costs, a final agenda, and a final list of attendees for each meeting.	(Dates to be negotiated.) 2015	$111,390.00
96					2016	$112,882.00
97					2017	$114,410.00
98					(Renewal 1 - 2018)	$117,566.00
99					(Renewal 2 - 2019)	$119,720.00

1113	Scoring and Reporting	Spring ELA/L Retake: Handscoring of Performance Tasks	Handscoring refers to the processes necessary for determining the rating of a student's response on the writing prompts or on the performance-based tasks in ELA/L and Mathematics that respondents may propose. Both paper-based and computer-based tests will contain performance tasks, and so the Contractor must have the capability to score both hand-written and key-entered student responses. The Department requires handscoring processes that are reliable and valid, as well as efficient in terms of time and expenditures. The handscoring process must follow the handscoring specifications. The final handscoring report, as described in the ITN, is required as evidence for payment. ITN Reference 7.5.4.5	(1) Provide Department email reflecting approval of the final handscoring report.	See Appendix B. Dates to be determined as part of contract negotiation.	$0.00

1277	Scaling, Equating, Scoring, and Special Psychometric Studies	Periodic: Development of the Test Construction Specifications	The Contractor will deliver Test Construction Specifications for ELA/Literacy and Mathematics, Algebra 1, Algebra 2, Geometry, and Retake Assessments. The final specifications shall be evaluated and approved by the Department. To the extent possible, the Department expects to be involved in any test construction activities for 2015 assessments still to be completed after contract execution. ITN Reference 7.6.0, 7.6.1, and 7.6.2	(1) Test Construction Specifications are secure, and therefore the Contractor shall provide a report which indicates the completed status of Specifications posted to Secure File Transfer Protocol (SFTP). (2) Provide Department email reflecting receipt and approval of the Test Construction Specifications.	May 2014	$96,473.00
1278					May 2015	$2,000.00
1279					May 2016	$0.00
1280					(Renewal 1 - May 2017)	$0.00
1281					(Renewal 2 - May 2018)	$0.00
1282					(Renewal 3 - May 2019)	$0.00

Attachment 1b - DELIVERABLES PRICING

Specify Component A, B, C, D or E (A-D): _____B_____

	A	B	C	D	E	F
1	**Deliverable Category**	**Contractor Deliverable**	**Deliverable Description**	**Evidence of Completion**	**Due Date(s)**	**Component B 3-8 Math**
1283	Scaling, Equating, Scoring, and Special Psychometric Studies	Periodic: Development of Test Forms for Field Test and/or Operational Administrations	All paper-based and computer-based forms for the tests, as agreed upon by the Department and memorialized in the approved Test Construction Specifications, must be submitted and approved. ITN Reference 7.6.0 and 7.6.1	(1) Test forms are secure, and therefore the contractor shall post them to SFTP. The Department shall maintain a copy of the materials on file as needed for evidence of completion of the deliverable. (2) Provide Department email reflecting receipt and approval of the final paper-based and computer-based forms.	July 2014	$39,726.00
1284					July 2015	$39,726.00
1285					July 2016	$39,726.00
1286					(Renewal 1 - July 2017)	$39,726.00
1287					(Renewal 2 - July 2018)	$39,726.00
1288					(Renewal 3 - July 2019)	$39,726.00
1289	Scaling, Equating, Scoring, and Special Psychometric Studies	Periodic: Development of the Sampling Plans	Detailed plan for sampling of students from the State. Sampling plan must describe the initial analyses on the SSR files, introducing plans for how to collect data, and the list of post-hoc analyses for representativeness checks when data from test administrations are in for operational processing. ITN Reference 7.6.2.2	(1) Final versions of sampling plans posted to SFTP. (2) Provide Department email reflecting receipt and approval of the sampling plans.	July 2014	$6,000.00
1290					July 2015	$2,000.00
1291					July 2016	$2,000.00
1292					(Renewal 1 - July 2017)	$2,000.00
1293					(Renewal 2 - July 2018)	$2,000.00
1294					(Renewal 3 - July 2019)	$2,000.00
1295	Scaling, Equating, Scoring, and Special Psychometric Studies	Periodic: Drawing Samples for Operational and/or Field Test Administrations	Delivering the data files including sampled units from the populations and the respective reports. Sampling report must describe the initial analyses on the SSR files, procedures for how to collect data, evaluate the representativeness of resulting sample and a list of post-hoc analyses for representativeness checks when data from test administrations are in for operational processing. ITN Reference 7.6.0, 7.6.1, and 7.6.2.2	(1) Data files, including sampled units from the populations, posted to SFTP. (2) Provide Department email reflecting receipt and approval of the samples.	August 2014	$6,000.00
1296					August 2015	$2,000.00
1297					August 2016	$2,000.00
1298					(Renewal 1 - August 2017)	$2,000.00
1299					(Renewal 2 - August 2018)	$2,000.00
1300					(Renewal 3 - August 2019)	$2,000.00
1301	Scaling, Equating, Scoring, and Special Psychometric Studies	Periodic: Development of the SES Specifications	Preparing a detailed plan for conducting all scaling and equating plans and procedures, scoring plans and procedures. The plan should include a comprehensive and detailed timeline for all tasks and events. The plan should also provide a detailed description of the outcomes produced from the	(1) SES Specifications (secure) posted to SFTP. (2) Provide Department email reflecting receipt and approval of the SES Specifications.	December 2014	$40,000.00
1302					December 2015	$2,000.00
1303					December 2016	$2,000.00
1304					(Renewal 1 - December 2017)	$2,000.00
1305					(Renewal 2 - December 2018)	$2,000.00

Specify Component A, B, C, D or E (A-D): _____B_____

	A	B	C	D	E	F
1	**Deliverable Category**	**Contractor Deliverable**	**Deliverable Description**	**Evidence of Completion**	**Due Date(s)**	**Component B 3-8 Math**
1306			description of the outcomes produced from the operational and/or field test SES activities, including data files and reports. The plan must be vetted by TAC members. ITN Reference 7.6.2.1		(Renewal 3 - December 2019)	$2,000.00
1307	Scaling, Equating, Scoring, and Special Psychometric Studies	Periodic: Performing SES Activities	Conducting all scaling and equating, and scoring activities as laid out in the specifications. ITN Reference 7.6.0, 7.6.1, and 7.6.2	(1) Submit Final Scaled Item Parameter Estimates and Scored Files (secure files) to the Department, posted to SFTP. (2) Provide Department email reflecting receipt and approval of the files.	May 2015	$200,000.00
1308					May 2016	$200,000.00
1309					May 2017	$200,000.00
1310					(Renewal 1 - May 2018)	$200,000.00
1311					(Renewal 2 - May 2019)	$200,000.00
1312					(Renewal 3 -May 2020)	$200,000.00
1313	Scaling, Equating, Scoring, and Special Psychometric Studies	Spring ELA/L and Mathematics: Develop Calibration Sampling Specifications	The contractor's sampling specifications must include analyzing the most recent SSR files and establishing a road map for gathering the required data proven to represent the demographic characteristics of the state and student performance. The specifications will also address the steps, procedures, and software required for replication of the sampling procedures by the Department. The specifications will be reviewed by the Department and TAC members, if necessary, and updated by the contractor for each subsequent administration. ITN Reference 7.6.2.2	(1) Submit final Calibration Sampling Specifications via SFTP. (2) Provide Department email reflecting receipt and approval of the specifications.	(Dates to be negotiated) 2015	$3,000.00
1314					2016	$1,000.00
1315					2017	$1,000.00
1316					(Renewal 1 - 2018)	$1,000.00
1317					(Renewal 2 - 2019)	$1,000.00
1318					(Renewal 3 - 2020)	$1,000.00
1319	Scaling, Equating, Scoring, and Special Psychometric Studies	Spring EOC: Develop Calibration Sampling Specifications	The contractor's sampling specifications must include analyzing the most recent SSR files and establishing a road map for gathering the required data proven to represent the demographic characteristics of the state and student performance. The specifications will also address	(1) Submit final Calibration Sampling Specifications via SFTP. (2) Provide Department email reflecting receipt and approval of the specifications.	(Dates to be negotiated) 2015	$0.00
1320					2016	$0.00
1321					2017	$0.00
1322					(Renewal 1 - 2018)	$0.00
1323					(Renewal 2 - 2019)	$0.00

1337	Scaling, Equating, Scoring, and Special Psychometric Studies	Periodic: Development of Standard Setting Work Plan	Prepare a Standard Setting Work plan for setting achievement level standards for ELA/Literacy, Mathematics, Algebra 1 &2, and Geometry assessments. Plan must include every detail of the methodology, internal and external data files, and the timeline for all of the activities during educator and reactor panel meetings. The Plan must be vetted by TAC members and the methodology must be approved by the department. ITN Reference 7.6.3.4	(1) Submit the final version of Standard Setting Work Plan and relevant materials, such as slides (secure materials), posted to SFTP. (2) Provide Department email reflecting receipt and approval of the documents.	January 2015	$2,000.00
1338	Scaling, Equating, Scoring, and Special Psychometric Studies	Periodic: Implement Achievement Level Standard Setting Meetings	Hold the required meetings and collect recommended cut scores from all relevant groups, as described in ITN Reference 7.6.3.4	(1) Submit the initial version of the Standard Setting Technical Report (secure file), including recommended cuts and impact data, to the Department via SFTP. (2) Provide Department email reflecting receipt and approval of the technical report and excel tables with interactive impact data and graphs.	October 2015	$161,561.00
1339	Scaling, Equating, Scoring, and Special Psychometric Studies	Periodic: Finalizing Standard Setting Technical Report	Preparing Technical Reports, as described in section 7.6.3.4. Collecting Feedback from the Department and Technical Advisory Committee (TAC), finalizing the reports after incorporating the feedback, and submitting the final versions of the reports to the Department. ITN Reference 7.6.3.4	(1) Submit the final version of the Standard Setting Technical Report (secure file) to the Department via SFTP. (2) Provide Department email reflecting receipt and approval of the technical report and excel tables with interactive impact data and graphs.	November 2015	$30,761.00
1340	Scaling, Equating, Scoring, and Special Psychometric Studies	Periodic: Development of Vertical Scaling Specifications	Preparing a detailed plan for conducting all vertical scaling procedures. The plan should include a comprehensive and detailed timeline for all tasks and events, as described in section 7.6.3.5 The plan must be vetted by TAC members. ITN Reference 7.6.3.5 (Repeated in contract renewal)	(1) Post the plan for Vertical Scaling (secure file) via SFTP. (2) Provide Department email reflecting receipt and approval of the Vertical Specifications.	November 2014	$9,000.00
1341					(Renewal 1 - November 2017)	$5,000.00

1342	Scaling, Equating, Scoring, and Special Psychometric Studies	Periodic: Performing Vertical Scaling Activities and Preparing Technical Report	Conducting all scaling and equating, and scoring activities as laid out in the specifications. ITN Reference 7.6.3.5 (Repeated in contract renewal)	(1) Submit Final Technical Report and Scored SSR Files (secure files), including vertically aligned scale scores, to the Department via SFTP. (2) Provide Department email reflecting receipt and approval of the documents and files.	August 2015	$18,407.00
1343					(Renewal 2 - August 2018)	$5,000.00
1344	Scaling, Equating, Scoring, and Special Psychometric Studies	Periodic: Development of Scale Drift Study Specifications	Preparing a detailed plan for conducting scale drift study. The plan should include a comprehensive and detailed timeline for all tasks and events, as described in section 7.6.3.6 The plan must be vetted by TAC members. ITN Reference 7.6.3.6	(1) Submit the plan for conducting the scale drift study (secure) to the Department via SFTP. (2) Provide Department email reflecting receipt and approval of the scale drift study specifications.	(Renewal 1 - July 2017)	$17,819.00
1345						$0.00
1346	Scaling, Equating, Scoring, and Special Psychometric Studies	Periodic: Performing Scale Drift Research and Preparing Technical Report	Conducting all scaling and equating, and scoring activities as laid out in the specifications. ITN Reference 7.6.3.6	(1) Submit Final Technical Report and rescaled item parameters (secure files) to the Department via SFTP. (2) Provide Department email reflecting receipt and approval of the documents and files.	(Renewal 2 - August 2018)	$45,291.00
1347						$0.00
1348	Scaling, Equating, Scoring, and Special Psychometric Studies	Periodic: Development of Specifications for Comparability Between Devices Delivering Assessments	Preparing a detailed plan for conducting comparability study. The plan should include a comprehensive and detailed timeline for all tasks	(1) Submit the plan for conducting the comparability study (secure file) to the Department via SFTP. (2) Provide Department email reflecting receipt and	November 2014	$5,400.00

	A	B	C	D	E	F
1	**Deliverable Category**	**Contractor Deliverable**	**Deliverable Description**	**Evidence of Completion**	**Due Date(s)**	**Component B 3-8 Math**
1349			and events, as described in section 7.6.3.7 The plan must be vetted by TAC members. The plan should include the degree of comparability of item-level and test-level statistics across devices. The plan should include the degree of comparability of item-level and test-level statistics across various input types. For the questions above, the plan should address to what degree of comparability can be obtained through scaling items onto a single metric, linking or concordance. The plan should also include what interactions exist among device, input type and item/task characteristics, grade, subject, and relevant student characteristics. ITN Reference 7.6.3.6.1	approval of the study specifications.		$0.00
1350	Scaling, Equating, Scoring, and Special Psychometric Studies	Periodic: Performing Study for Comparability Between Devices Delivering Assessments, Preparing its Final Report, and Recommendations with TAC Committee	Conducting all of the planned analyses, preparing its technical report, and sharing the findings and recommendations with TAC members. ITN Reference 7.6.3.6.1	(1) Submit Final Report and Recommendations to the Department. These materials are secure, and therefore contractor shall post them to SFTP. (2) Provide Department email reflecting receipt and approval of the documents and files.	August 2015	$29,752.00
1351						$0.00
1352	Scaling, Equating, Scoring, and Special Psychometric Studies	Periodic: Development of a study plan for linking Florida Standards Assessments to other assessments measuring the same standards	Preparing a detailed plan for conducting the linking study. The plan should include a comprehensive and detailed timeline for all tasks and events, as described in section 7.6.3.8 The plan must be vetted by TAC members.	(1) The plan for conducting comparability study is secure, and therefore contractor shall post them to SFTP. (2) Provide Department email reflecting receipt and approval of the study specifications.	November 2015	$900.00

Attachment 1b - DELIVERABLES PRICING

Specify Component A, B, C, D or E (A-D): _____B_____

	A	B	C	D	E	F
1	**Deliverable Category**	**Contractor Deliverable**	**Deliverable Description**	**Evidence of Completion**	**Due Date(s)**	**Component B 3-8 Math**
1353			The plan should include a review of the most promising and most feasible methods in linking, discuss the technical feasibility of such methods, and explain the process of establishing the linking relationship(s) in detail. ITN Reference 7.6.3.6.2			$0.00
1354	Scaling, Equating, Scoring, and Special Psychometric Studies	Periodic: Linking Florida Standards Assessments to other assessments	Conducting all of the planned analyses, preparing a final technical report, and sharing the results of linked relationships with TAC committee to discuss the validity of interpretations. ITN Reference 7.6.3.6.2	(1) Submit Final Report and Recommendations (secure files) to the Department via SFTP. (2) Provide Department email reflecting receipt and approval of the documents and files.	August 2016	$9,868.00
1355						$0.00
1356	Scaling, Equating, Scoring, and Special Psychometric Studies	Periodic: Development of a study plan for the linking Florida Standards Assessments to International Assessments	The Contractor's plan will include, review of the most promising and most feasible methods likely to be used in international linking, discuss the technical feasibility of each method given the nature and design of the Florida Standards Assessments and those of international assessments such as PISA and TIMSS, propose method(s) for linking the scales of assessments, propose alternative ways for collecting data, explain the process of establishing the linking relationship(s) in detail, and provide a comprehensive and detailed timeline for all tasks and events, as described in section 7.6.3.9. The contractor will share the report with the Department and its TAC members. Upon approval from the Department, the contractor will finalize the plan for the linking. ITN Reference 7.6.3.6.3	(1) The plan for conducting the linking study is secure, and therefore contractor shall post them to SFTP. (2) Provide Department email reflecting receipt and approval of the study specifications.	November 2015	$900.00
1357						$0.00

1	**Deliverable Category**	**Contractor Deliverable**	**Deliverable Description**	**Evidence of Completion**	**Due Date(s)**	**Component B 3-8 Math**
1358	Scaling, Equating, Scoring, and Special Psychometric Studies	Periodic: Linking Florida Standards Assessments to International Assessments	Conducting all of the planned analyses, preparing a final technical report, and sharing the results of linked relationships with TAC committee to discuss the validity of interpretations. ITN Reference 7.6.3.6.3	(1) Submit Final Report and Recommendations to the Department. These materials are secure, and therefore contractor shall post them to SFTP. (2) Provide Department email reflecting receipt and approval of the documents and files.	August 2016	$900.00
1359						$0.00
1360	Program Management	Periodic: Production Schedule	The production schedule shows the Department's beginning and ending review dates by test document for each review round. ITN Reference 7.7.2	(1) Appearance of schedule in weekly management report (2) Provide Department email reflecting approval of proposed or revised production schedule.	April 15, 2014	$66,198.00
1361					April 15, 2015	$27,930.00
1362					April 15, 2016	$27,930.00
1363					(Renewal 1 - April 15, 2017)	$27,930.00
1364					(Renewal 2 - April 15, 2018)	$27,930.00
1365					(Renewal 3 - April 15, 2019)	$27,930.00
1366	Program Management	Periodic: Program Management Meetings	The contractor will coordinate regular management meetings between the contractor and Department staff. The number and type of meetings are provided in 7.7.5 of the ITN.	(1) Include support for all meetings since the previous invoice. (2) Provide the meeting costs, a final agenda, and a final list of attendees for each meeting.	2015	$121,879.00
1367					2016	$122,426.00
1368					2017	$122,851.00
1369					(Renewal 1 - 2018)	$123,260.00
1370					(Renewal 2 - 2019)	$124,154.00
1371					(Renewal 3 - 2020)	$124,566.00
1372	Program Management	Periodic: Program Management Staff	The work described in the ITN constitutes a large, complex, challenging program that requires year-round activity and close attention to overlapping tasks for different years and the impact on project resources. The contractor is expected to provide a sufficient number of highly-qualified personnel to work closely with the Department to manage the contract. Specific requirements are in 7.7.2 of the ITN.	(1) Include support for program management staff operational for the invoice period. (2) Provide an organization chart with the appropriate staff indicated for each invoice period. (Quarterly invoices to occur in February, May, August, and November)	2015	$1,139,500.00
1373					2016	$1,276,463.00
1374					2017	$1,287,729.00
1375					(Renewal 1 - 2018)	$1,102,105.00
1376					(Renewal 2 - 2019)	$1,122,579.00
1377					(Renewal 3 - 2020)	$1,129,158.00
1378	Program Management	Periodic: Program Management Reports: Weekly Management and Action Item Report	The Weekly Management Report and Action Item Report will report the status of recent and upcoming tasks, highlighting those leading up to deliverables and critical tasks, report progress on program issues, identify unresolved issues, and maintain a list of requests requiring change orders	(1) For each invoice period, provide one management report from each month since the previous invoice period. (Quarterly invoices to occur in February, May, August, and November)	2014	$112,459.00
1379					2015	$112,459.00
1380					2016	$112,459.00
1381					(Renewal 1 - 2017)	$112,459.00
1382					(Renewal 2 - 2018)	$112,459.00

Attachment 1b - DELIVERABLES PRICING

Specify Component A, B, C, D or E (A-D): _____B_____

1	**Deliverable Category**	**Contractor Deliverable**	**Deliverable Description**	**Evidence of Completion**	**Due Date(s)**	**Component B 3-8 Math**
			maintain a list of requests requiring change orders or amendments. The weekly report will be provided to the Department by no later than noon one day prior to the weekly program management conference calls and will reflect the previous week's work. ITN Ref 7.7.6		(Renewal 3 - 2019)	$112,459.00
1383						
1384	Program Management	Periodic: Annual Program Review	Review will include a record of the contractor's services and deliverables in response to contractual/ITN requirements. This review must identify major program accomplishments and successes, as well as areas of the program that require changes and improvement in the upcoming year. The review is intended to be a history of program events and to describe recommended improvements or changes for subsequent years. The annual review will be based on information gathered by the contractor's program and project management staff throughout the year. The review will address all aspects of program service and products including management, technology, interpretive products, communications, development, test production, test administration, materials shipping/pickup, scoring, and reporting processes. It will also follow the annual administrative cycle, beginning with fall and ending with the following summer. ITN Reference 7.7.6	(1) Provide evidence of Department acceptance and approval of the annual program review for the previous administration year.	November 2015	$54,642.00
1385					November 2016	$54,642.00
1386					November 2017	$54,642.00
1387					(Renewal 1 - November 2018)	$54,642.00
1388					(Renewal 2 - November 2019)	$54,642.00
1389					(Renewal 3 - November 2020)	$54,642.00
1390	Program Management	Periodic: Program Management Reports: Collect Accounting Reports	A summary of the Quarterly Accounting Reports, including expenditures by program task and level of effort as well as expenditures and balances of Reimbursable Funding Categories identified in Section 7.7.9, including balances resulting from executed change orders and contract amendments	(1) For each invoice period, provide the quarterly accounting reports. (Quarterly invoices to occur in February, May, August, and November)	2014	$69,917.00
1391					2015	$69,797.00
1392					2016	$69,797.00
1393					(Renewal 1 - 2017)	$69,797.00
1394					(Renewal 2 - 2018)	$69,797.00
